Note: Although in general the board believes it desirable to complete the three years of formal training before satisfying the requirements of practice a reversal of this order is acceptable.

F. *Graduates of Foreign Schools:* At the present time neither the Council on Medical Education and Hospitals of the American Medical Association nor any other educational agency in the United States has the machinery to evaluate adequately the quality of foreign medical education. This board must, therefore, evaluate the fundamental educational credentials and other qualifications of each individual candidate educated abroad who applies for admission to examination. (See requirements for graduates of foreign schools.)

G. *Candidates Graduating Prior to 1937:* The requirement of three years of graduate training will not apply to candidates graduating from approved medical schools in the United States and Canada in 1936 or previous thereto, provided such candidates have limited their work to the field of internal medicine for at least two years, and provided each candidate is recognized as an internist by his colleagues in his community.

H. *"Preceptor Training":* Preceptor type training is not recognized in satisfaction of any part of the three year requirement of formal graduate training.

I. The board will grant one year of graduate training credit, or one year in satisfaction of the requirements of practice, regardless of assignment, for active duty as a commissioned officer in the United States Army, Navy, or United States Public Health Service for one year or more, beginning on or subsequent to Dec. 7, 1941 and terminating on or before Jan. 1, 1947.

Depending upon the nature of the duty assignments, after Jan. 1, 1947 active duty as commissioned officer in the United States Army Reserve Corps, United States Naval Reserve Corps, or United States Public Health Service may be applied in satisfaction of one year of the requirements of practice but will not be regarded as satisfying any part of the graduate training requirements, unless the officer is assigned as a resident in internal medicine, neurology, psychiatry, or pathology in an Army, Navy or United States Marine Hospital which is approved by the Council on Medical Education and Hospitals of the American Medical Association for resident training in the divisions of medicine referred to.

PRINCIPLES OF TRAINING

The American Board of Internal Medicine is interested in the fact that the candidate has embarked on a career of study voluntarily and has thereby expressed the desire to excel and to participate personally in the world's progress in medicine.

Preparation must be based on years of continuous thoughtful study. Therefore, in suggesting a program for those who wish advice, the board hopes to assist the candidates to avoid inferior and superficial programs which may lead to failure and disappointment in later years.

The board believes that all internists should have a sound fundamental knowledge of anatomy, bacteriology, biochemistry, pathology, pharmacology, and physiology. Such knowledge is essential to the continued progress of any internist. The board anticipates that adequate training will be obtained in the basic sciences as applied to internal medicine during a formal three year residency program.

The board wishes to emphasize that time and training are but a means to the end of acquiring a broad knowledge of internal medicine which the candidate must demonstrate to the board in order to justify it in certifying that he is competent to practice internal medicine as a specialty. The responsibility of acquiring the knowledge rests with the candidate. The responsibility of maintaining the standards of knowledge required for certification devolves on the board.

APPLICATION

Candidates for examination must make their application on a prescribed form which may be obtained from the office of the assistant secretary-treasurer.

The application must contain a record of the candidate's premedical and medical training as well as of internships, residencies, graduate study, hospital or dispensary staff appointments, teaching positions, service in the armed forces, membership in medical societies, medical papers published, and the names of three or more well known internists to whom the board may write for professional and character reference.

The application must be accompanied by one recent, signed photograph of the candidate *mounted* on the application, and the registration and examination fee of $30, which fee will cover both the written and oral examinations. An additional fee of $10 will be required when the certificate is issued.

METHOD OF EXAMINATION

The examinations for certification by the board comprise two parts: Part I is written; Part II is clinical and is an oral examination. The written examination is held simultaneously in different sections of the United States and Canada on the third Monday of February and October of each year. This examination is divided into a morning and afternoon period for each of which three hours are allowed. The questions asked are framed in such manner as the board elects; in general, there will be questions designed to test the applicant's knowledge of applied physiology, anatomy, physiological chemistry, pathology, bacteriology and pharmacology as related to internal medicine, and his basic clinical acumen.

Candidates must pass the written examination before admission to the oral examination will be authorized. The oral examination is conducted under the direct supervision of the board. It is held near the time and place of the annual meetings of the American Medical Association and of the American College of Physicians, or at such other times and places as the board may designate. The examination is conducted at the bedside of the patient. Each candidate is assigned two or more patients and is expected to be sufficiently familiar with whatever problems present themselves as to satisfy the board of his clinical expertness.

REEXAMINATION

Effective Jan. 1, 1946, not more than three written examinations will be authorized. The interval between the first and the second written examinations will be one year. The interval between the second and third written examinations will be not less than two years. A longer period may be required by the board. A fee of $10 is required for each additional written examination.

This ruling does not make it mandatory for a candidate to repeat the examination within one or two years, since each candidate may elect a longer interval.

Not more than three oral examinations are authorized. The interval between the first and second oral examinations will be one year. The interval between the second and third oral examinations will be not less than two years. A longer period may be required by the board. Candidates may elect a longer period if desired. A fee of $10 dollars is required for each additional oral examination.

CERTIFICATES

The certificate issued by the American Board of Internal Medicine shall be in such form as to comply with the articles of incorporation and the by-laws and shall be signed by the officers and members of the board, and shall bear the official seal of the board.

---

[3] *Certification by the head of the department in which the work was done is required.*

Certificates of the board will be issued to candidates who have satisfactorily completed the written and oral examinations, and have been found qualified by the board to practice the specialty of internal medicine. Specialty certification will be designated on the certificate, for those so certified.

ADVISORY BOARDS

Allergy, cardiovascular disease, gastroenterology and pulmonary diseases are recognized specialties.

All candidates must pass the written and oral examinations in internal medicine before admission to examination in a special of medicine. The specialty examinations are oral only and may be taken the day following the examination in general medicine, or at any other regularly scheduled oral examination.

Applications for consideration in the specialties referred to must be approved by the Advisory Board concerned and confirmed by this board.

Application forms will be forwarded on request to the office of the assistant secretary-treasurer.

Please address all official correspondence to the assistant secretary-treasurer.

AMERICAN BOARD OF NEUROLOGICAL SURGERY

Howard C. Naffziger, Chairman, San Francisco.
Max M. Peet, Vice-Chairman, Ann Arbor, Mich.
William J. German, Secretary-Treasurer, 310 Cedar Street, New Haven, Conn.
A. W. Adson, Rochester, Minn.
C. C. Coleman, Richmond, Va.
W. McK. Craig, Rochester, Minn.
Leo M. Davidoff, New York.
Joseph P. Evans, Cincinnati.
Gilbert Horrax, Boston.
R. Eustace Semmes, Memphis.
W. P. Van Wagenen, Rochester, N. Y.

ORGANIZATION

The principle of certification in medical specialties is now well established. Recognizing the need for detailed training and special qualifications for the practice of neurological surgery, representatives of both the Society of Neurological Surgeons and the Harvey Cushing Society held an informal meeting on March 27, 1939, to consider this matter. Later, the group was enlarged by representatives from the Section on Nervous and Mental Diseases of the American Medical Association, the Section on Surgery of the American Medical Association, the American Neurological Association and the American College of Surgeons.

It was unanimously resolved by the enlarged group that a separate board be formed for certification in neurological surgery. Approval of the board by the Advisory Board for Medical Specialties and the Council on Medical Education and Hospitals of the American Medical Association was given. The American Board of Neurological Surgery was incorporated in the State of Delaware on Aug. 1, 1940.

PURPOSES

1. To encourage the study, improve the practice, elevate the standards and advance the science of neurological surgery and thereby to serve the cause of public health.

2. To grant and issue to physicians duly licensed by law, certificates or other recognition of special knowledge in neurological surgery and to suspend and revoke the same.

3. Certificates granted or issued by the corporation shall not confer or purport to confer upon any person any legal qualification, privilege or license to practice neurological surgery, nor purport to be issued under or in pursuance to or by virtue of any statutory or governmental sanction or authority. Recipients of certificates shall not by virtue thereof become members of the corporation nor shall they be entitled by virtue thereof to vote on any matter whatsoever.

4. To receive and act upon applications, from physicians duly licensed by law, for certificates and to require the payment of and to receive from each applicant therefor application, examination and other fees in such amounts as from time to time may be fixed by the Board of Directors.

5. To establish, maintain, alter and amend rules and regulations, standards and qualifications for the granting and issuing and for the suspension, surrender and revocation of certificates.

6. To determine by examination, investigation and otherwise the fitness and competence of specialists in neurological surgery who shall apply for certificates and to prepare, provide, control and conduct examinations, written, oral and otherwise, for such purpose and to determine the results of such examinations.

7. To furnish to the public, hospitals, medical schools, medical societies and practitioners of medicine and surgery lists of neurological surgeons who from time to time have been granted certificates by this corporation.

MEMBERSHIP

The membership of the corporation shall be twelve in number and shall be nominated as follows:

Four members by the Society of Neurological Surgeons
Three members by the Harvey Cushing Society
One member by the Section on Nervous and Mental Diseases of the American Medical Association
One member by the Section on Surgery of the American Medical Association
One member by the American Neurological Association
One member by the American College of Surgeons
One member by the American Academy of Neurological Surgery

All nominees shall be subject to the approval of the Board of Directors. Any vacancies shall be filled in the same manner as the selection of the original members. The board shall be empowered to fill unexpired terms of members to serve until the society which elected them can act in filling the vacancies.

The number of members and directors may be reduced to not less than five members and thereafter increased to not more than twelve members, and the allocation from the societies may be changed, on the affirmative vote of not less than two-thirds in number of the members or directors.

All future members of the board shall be diplomates of the American Board of Neurological Surgery.

The term of membership of four of the original members shall be for six years, the term of four for four years, and the term of the remaining four for two years, to be determined by lot at the first meeting of the Board of Directors. All members subsequently elected shall continue for a term of six years.

The members shall meet at least once yearly at a time and place to be fixed by the chairman on at least twenty days' written notice. Other meetings may be called by the chairman as often as may be necessary, each call to state the date and place of the meeting, and notice thereof shall be given to all of the members at least twenty days in advance.

The presence in person of a majority in number of the members of the corporation shall be necessary and sufficient to constitute a quorum for the transaction of any business at any meeting of the members, annual or special.

REQUIREMENTS FOR CERTIFICATION

Group A. *Those certified without examination.* On invitation by the board and written application made within two years from January 1, 1940, the following may be accepted as eligible for certification upon the approval of the Board of Directors and on the production of evidence of satisfactory moral and ethical standing in the profession.

1. Individuals of professorial rank in approved medical schools of the United States or Canada whose surgical practice is limited to neurological surgery.

2. Those who have specialized in neurological surgery for ten years prior to January 1, 1940.

Group B. *Those certified by examination. Eligibility for examination:* To be eligible for examination and certification by the board, all candidates must possess the preliminary and basic medical qualifications required by the Advisory Board for Medical Specialties as applied to all specialties as follows:

1. General Qualifications:

(*a*) Moral and ethical standing in the profession satisfactory to the Board of Directors.

(*b*) Membership in the American Medical Association or, by courtesy, membership in such Canadian or other medical societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the American Medical Association.

(*c*) Those who limit their surgical activities to the practice of neurological surgery.

(*d*) It shall be discretionary with the board to accept for examination candidates who have been in practice more than six years but whose formal training fails to meet the full requirements.

(*e*) Properly qualified candidates who are permanent residents in and citizens of other countries and are legally qualified to practice medicine there, and who have received their training in neurological surgery in the United States of America or Canada may apply for certification by the American Board of Neurological Surgery.

2. Professional Standing:

(*a*) Graduation from a medical school of the United States or Canada recognized by the Council on Medical Education and Hospitals of the American Medical Association, or graduation from a foreign school which is acceptable to the American Board of Neurological Surgery, Inc.

(*b*) Completion of a surgical internship of not less than one year in a hospital approved by the same Council, or its equivalent in the opinion of the board.

3. Special Training:

A period of graduate study in a recognized graduate school of medicine of not less than three years beyond the intern year, or in an approved hospital or under a sponsorship acceptable to the American Board of Neurological Surgery, Inc., for the training of neurological surgeons.

This period of special training shall be of such a character that the relation of the basic sciences of anatomy, physiology, pathology, bacteriology, and biochemistry is emphasized. Knowledge of these sciences as applied to practice of neurological surgery will be required in the examination.

An additional period of not less than two years in the practice of neurological surgery.

APPLICATIONS

An application on the official application blank in such form as may be adopted from time to time by the Board of Directors in order to be considered at any meeting, must be in the hands of the secretary-treasurer of the board not less than six days before the date of such meeting.

The secretary-treasurer of the board on receipt of an application shall forthwith make inquiries from those to whom the candidate refers and from such other persons as the secretary-treasurer may deem desirable, after which he shall forward the application to the Committee on Credentials. This committee shall consider the application and other information available and notify the secretary-treasurer its recommendation whether or not the applicant is acceptable. The certification of a candidate shall be approved by a majority of the members of the entire board at any meeting held for such certification.

PLEDGE

Each candidate is required to sign the following pledge:

"I hereby make application to the American Board of Neurological Surgery, Inc., for the issuance to me of a Certificate of Qualification as a specialist in neurological surgery and for examination relative thereto, all in accordance with and subject to its rules and regulations. Upon the issuance of the certificate I agree to and do become bound by the By-Laws of the American Board of Neurological Surgery, Inc., insofar as applicable.

"I agree to disqualification from examination or from the issuance of a Certificate of Qualification or to forfeiture and redelivery of such Certificate of Qualification in the event that any of the rules governing such examination are violated by me or for any one of the reasons set forth in the By-Laws. I agree to hold said American Board of Neurological Surgery, Inc., its members, examiners, officers and agents free from any damage or claim for damage or complaint by reason of any action they, or any of them, may take in connection with this application, such examination, the grade or grades given with respect to any examination and/or the failure of said Corporation to issue to me such Certificate of Qualification."

PAYMENT OF FEES

The fee for certification, with or without examination, shall be seventy-five dollars ($75).

The candidate for examination on filing his application shall accompany it with an application fee of twenty-five dollars ($25). When notified by the secretary-treasurer that he is eligible for examination he shall send the examination fee of fifty dollars ($50) to the secretary-treasurer at least two weeks before the date of the examination. The application fee will be returned if the candidate is not accepted for examination.

REEXAMINATION

A candidate who has failed in one examination is eligible to reexamination in the subject, or subjects, in which he failed, within three years, on payment of a reexamination fee of ten dollars ($10). A candidate who has failed in one examination and who does not apply for reexamination within three years or a person who has applied within that time but has failed a second time will be considered a new applicant.

FORM AND EXECUTION

Certificates issued by the corporation shall be to the effect that the holder has been found qualified to practice neurological surgery. They shall be in such form, in compliance with the Certificate of Incorporation, as the Board of Directors shall approve and shall be signed by the Chairman or the Vice-Chairman and by the Secretary-Treasurer and shall have impressed thereon the official seal of the corporation.

REVOCATION OF CERTIFICATES

Any certificate issued by the board shall be subject to revocation at any time the board shall determine in its sole discretion that the candidate to whom the certificate was issued either was not properly qualified to receive it, or has since become disqualified.

Further information may be obtained from the secretary-treasurer.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY

Walter T. Dannreuther, President, New York.
Joseph L. Baer, Vice President, Chicago.
Ludwig A. Emge, Vice President, San Francisco.
Paul Titus, Secretary-Treasurer, 1015 Highland Building, Pittsburgh 6.
Norman F. Miller, Ann Arbor, Mich.
Edward A. Schumann, Philadelphia.
Willard R. Cooke, Galveston, Texas.
F. Bayard Carter, Durham, North Carolina.
Robert L. Faulkner, Cleveland.

ORGANIZATION

In 1930 the American Association of Obstetricians, Gynecologists, and Abdominal Surgeons, the American Gynecological Society, and the Section on Obstetrics and Gynecology of the American Medical Association, each elected three Fellows to constitute the American Board of Obstetrics and Gynecology.

Dr. Walter T. Dannreuther of New York, Dr. Paul Titus of Pittsburgh and Dr. Grandison D. Royston of St. Louis were appointed to represent the American Association of Obstetricians, Gynecologists, and Abdominal Surgeons; Dr. Jennings C. Litzenberg of Minneapolis, Dr. Joseph L. Baer of Chicago, and Dr. E. A. Schumann of Philadelphia were appointed to represent the American Gynecological Society; Dr. Fred L. Adair of Chicago, Dr. R. D. Mussey of Rochester, Minn., and Dr. E. D. Plass of Iowa City were appointed to represent the Section on Obstetrics and Gynecology, and Abdominal Surgery of the American Medical Association. Since formation of the board several of the original members have resigned and others have been duly appointed to fill their places.

The board was incorporated and organized and held its first meeting in September 1930. At that time the By-Laws were adopted and provision was made by resolutions for its proper functioning.

This board had been in the process of organization since 1927 and put into action a determined effort on the part of these three national organizations to improve the standards of practice of obstetrics and gynecology.

PURPOSES

First. To elevate the standards and advance the cause of obstetrics and gynecology.

Second. To determine the competence of practitioners professing to be specialists in obstetrics and gynecology.

Third. To arrange, control and conduct examinations to test the qualifications of voluntary candidates appearing before the board for certification as specialists in obstetrics and gynecology.

Fourth. To grant and issue certificates of qualification as specialists in the field of obstetrics and gynecology to candidates successful in demonstrating their proficiency.

Fifth. To serve the public, hospitals and the medical schools by preparing lists of specialists certified by the board.

These activities proceed from the certificate of incorporation in which it is stated that "the nature of the business and the objects or purposes proposed to be transacted, promoted and carried on by it" are as follows:

"To encourage the study, improve the practice, and advance the cause of obstetrics and gynecology, subjects which should be inseparably interwoven; and to grant and to issue to physicians duly licensed by law, certificates or other equivalent recognition of special knowledge in obstetrics and gynecology."

VALUE OF CERTIFICATE

The national obstetrical and gynecological organizations, which have participated in the formation of the board and are sponsoring its activities, as well as other societies, attach considerable importance to its certificate. Both the medical and the lay public, including hospital directors, have come to utilize the certificate from this board freely as a means of determining who are well grounded as specialists in obstetrics and gynecology.

Lists of those holding certificates from this board who are limiting their practice to obstetrics and gynecology are published in the Directory of Medical Specialists; similar lists are published by the *American Journal of Obstetrics and Gynecology*, and also appear in the *American Medical Directory*. This latter indicates diplomates of this and other boards by means of numerical symbols appearing in the biographic records but does not give such special recognition to diplomates who are not members of the American Medical Association.

Each certificate granted or issued does not of itself confer or purport to confer upon any person any degree or legal qualifications, privileges or license to practice obstetrics or gynecology, nor does the board intend in any way to interfere with or limit the professional activities of any duly licensed physician. Its chief aim is to standardize qualification for specialists in obstetrics and gynecology, and to certify as specialists those who voluntarily appear before the board for such recognition and certification, according to its regulations and requirements.

It was never intended by this board that certification should be required by any hospital as a prerequisite to appointment in various staff positions, even though certification or its full equivalent is considered a desirable requisite to appointment in key positions, as on the Senior or Chief Staff, especially of hospitals expecting to conduct approved services for training of residents.

This board does not subscribe to any hospital or medical school rule that certification is to be required for medical appointments in ranks lower than Chief or Senior Staff of hospitals, or Associate Professorship in schools of medicine, for the obvious reason that such appointments constitute desirable specialist training.

REVOCATION OF CERTIFICATES

Each Certificate of Qualification may be revoked by this board in the event that:

1. Any representation or statement made to the board or to any of its representatives by the physician so certified, including the statements contained in his application for certification, shall have been false or intentionally misleading.

2. The physician so certified shall not *in fact* have been eligible to receive certification, irrespective of whether or not the facts constituting such ineligibility were known to or could have been ascertained by this board, its members, directors, examiners, officers, or agents at or before the time of issuance of such Certificate of Qualification.

3. Any rule governing examination for certification shall have been violated by the physician so certified and the fact of such violation shall not have been ascertained until after the issuance of the Certificate of Qualification.

4. The physician so certified shall fail to abide by the regulations governing the limitation of his practice to the specialty of obstetrics and gynecology.

5. The physician so certified shall violate the standards of ethical practice of medicine then accepted by organized medicine in the locality in which he shall be practicing and, without limitation of the foregoing, the forfeiture, revocation or suspension of his license to practice medicine, or the expulsion from, or suspension from the rights and privileges of membership in, the American Medical Association or any state or county society affiliated therewith, any recognized Canadian medical society, the American Association of Obstetricians and Gynecologists and Abdominal Surgeons or the American Gynecological Society shall be conclusive evidence of a violation of such standards of ethical practice of medicine.

6. The physician so certified shall fail to comply with or violate, or the issuance or receipt by him of such Certificate of Qualification shall have been contrary to or in violation of, the Certificate of Incorporation, the By-Laws or the Rules and Regulations of this board.

Upon revocation of any Certificate of Qualification by this board as aforesaid, the holder thereof shall return his Certificate of Qualification and all other evidence of certification to the secretary of the board and his name shall be removed from the list of certificate holders of this board.

PREREQUISITES TO ELIGIBILITY

Each applicant before he shall become eligible to receive such certificate or other evidence of recognition:

1. Must have had conferred on him a degree in medicine by an institution of learning approved by the Advisory Board for Medical Specialties and the Council on Medical Education and Hospitals of the American Medical Association.

2. Must establish in a manner satisfactory to the board of directors that he is a physician duly licensed to practice medicine, and

a. That he is of high ethical and professional standing.

b. That he has received adequate training in both obstetrics and gynecology as a specialty. Training in one branch only is not acceptable.

3. Must make application for investigation of his credentials and a survey of his character.

4. Must assure the board that he is limiting his practice to obstetrics and/or gynecology and that he intends to continue to do so, except for military duties, having limited for at least six (6) months before making application (except for active military duty).

5. Must have membership in the American Medical Association, or membership in such Canadian or other medical societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the American Medical Association. (Membership in the American Medical Association or equivalent society membership is waived, temporarily, for men in the Army or Navy, especially for those who proceeded directly or almost so from hospital services into Army or Navy Services, on a statement of intention to join promptly upon return to civilian practice.)

6. This board will not accept applicants for examination who are not full citizens of the United States or of Canada, though they be residents of either country. Foreign born applicants must have been certified by either the National Board of Medical Examiners or licensed to practice medicine in the United States or Canada by a state or provincial board of licensure. Notarized statements, *not* original citizenship papers, must be furnished when the application is filed, attesting to the fact of full citizenship in the United States or Canada, if the applicant is foreign born. Further there will be required a probationary period of at least three (3) years from the date of licensure in the practice of medicine in these countries before such a candidate may be admitted to examination.

7. The board accepts the fifth or "intern" medical school year required at some schools in lieu of the usual fifth or intern "clinical training" year following graduation. As a substitute for special training, service with a qualified obstetrician-gynecologist preceptor, preferably one who has been certified by the board, may be acceptable. The exact time basis for this has not been specified, and each case must be reviewed and decided individually by the Credentials Committee after the application is submitted in the regular manner. The time allowance for this type of training will vary with the amount of work done with the preceptor. Opportunity for personal responsibility during this period of training is essential.

8. The board conformed with the general acceleration in programs in medical education in that it will accept a period of nine "accelerated" months as an academic year in satisfying the requirement for each of three years of residency training. Such allowances can be made only for services during the wartime period of the official "accelerated program" and are not made for services before 1944 or after the discontinuance of this acceleration in 1946.

9. The period of special training should emphasize the relation of the basic sciences, anatomy, pathology, physiology, biochemistry, and bacteriology, to the application of surgical principles which are fundamental in all branches of surgery. In addition, the candidate must understand and be trained in the following subjects, viz., the care of emergencies, shock, hemorrhage, blood replacement, electrolyte and fluid balance, protein and nitrogen balance, choice of anesthetics, chemotherapy, acidosis, and alkalosis, narcotics and hypnotics, wound healing, etc.

10. Credit for graduate courses in the basic sciences which involve laboratory and didactic teaching rather than clinical experience or opportunities will be given credit for the time spent up to a maximum period of not more than six months regardless of the duration of the course.

11. An acceptable residency is one which has been approved by the Council on Medical Education and Hospitals of the American Medical Association jointly with this board.

12. The board has ruled that physicians who accept male patients in their private or other practice, for operative or other care, cannot be regarded as specialists in obstetrics and gynecology, except by special ruling when this is related to active military duty.

13. This board deprecates engagement in fields of practice other than that in which candidates profess to be specialists. The board does not exclude from examination, however, obstetricians and/or gynecologists who practice abdominal

surgery and urology in the female, as well as breast surgery, because of the correlation of these activities.

Military service or any other similar patriotic service, such as work with Selective Service Boards, etc., have not been construed as nonlimitation of practice in violation of the board regulations.

REQUIREMENTS

The requirements for all candidates will be uniform, as follows:

1. Completion of at least one (1) year intern service in a hospital approved by the Council on Medical Education and Hospitals of the American Medical Association. (This need not be a general rotating internship, although this latter is preferred.)

(A second year general internship is to be considered as one of a candidate's years of practice. No credit will be given toward special training during a second year general internship.)

2. A minimum of seven (7) years of practice after the intern year, including at least three (3) years of residency training in approved institutions, or adequate preceptorship training as a formal assistant, preferably full time, in approved institutions or with recognized specialists in obstetrics and/or gynecology satisfactory to the Board of Directors.

This board, in cooperation with the Council on Medical Education and Hospitals of the American Medical Association, surveys institutions providing acceptable residencies in obstetrics and gynecology.

The American Board of Obstetrics and Gynecology establishes herewith requirements for its approval of a residency in a hospital department or service:

1. The chief of the Active Visiting Staff of the Department must be certified by this board with at least one other of his subordinates, the remaining members of the Staff must be otherwise acceptably qualified to teach and to practice obstetrics-gynecology.

2. In instances where the services of obstetrics-gynecology are not combined but are separate in any given hospital, the chief of each such service and at least one of his subordinates must be certified.

3. If obstetrics and gynecology are not combined in one department, approval can be granted only if arrangements are made for some degree of rotation of residents between both services.

4. If gynecology is classified in the given hospital as a subdivision or subservice of surgery, approval cannot be granted for residency training in gynecology.

5. Exceptions to the foregoing, in respect to the certified status of chiefs of service and others as outlined above, can be made only by unanimous assent of the Committee on Postgraduate Survey, for adequate and justifiable reasons. As examples of the latter, the degree of F.A.C.S. in obstetrics-gynecology might be accepted in lieu of one of the two required certifications if the general reputation of the person concerned is known to the committee as national or sectional in scope, or a professorial rank without certification might be acceptable.

6. It should be recalled by all concerned that credits for graduate training may be obtainable for residency or assistantship service in hospitals not officially approved for residency training. Each such case must be individually considered, and credits will be largely dependent on the teaching qualifications of those in charge of the service, and the clinical facilities of the hospital in question.

Lists of formally approved institutions for special residency training appear regularly in certain issues of the Journal of the American Medical Association. Detailed information about any of these can be obtained by applying to the American Medical Association.

It is possible for candidates trained in some unclassified or as yet unapproved hospitals to obtain credit for this training if properly supervised. Each such case must be considered on its own merits.

Candidates should offer as sponsors or references, two Diplomates of this board with whom they are presently in contact, rather than men under whom they served as residents only.

APPLICATION AND FEES

Application must be made on a special blank which will be furnished by the secretary's office, 1015 Highland Building, Pittsburgh 6, Pa., and must be forwarded with the other required credentials and the application fee to the secretary's office at least ninety (90) days prior to the scheduled date of the examinations.

Application fee.......................................$15.00

Make checks payable to American Board of Obstetrics and Gynecology. Not returnable.

(Applications will not be considered for classification and action by the Credentials Committee unless accompanied by the application fee.)

Examination fee.......................................$85.00

(Payable when the candidate is notified of acceptance for examination. Not returnable after the candidate has been officially accepted by the Credentials Committee and notified to report for examination.)

Total fee.......................................$100.00

The fees have been carefully computed on a basis of cost of examinations and are used entirely for administrative expenses. Examiners serve without compensation other than actual expenses.

Many prospective candidates write the secretary's office outlining in their letters their training qualifications and asking informally if they are eligible. Any candidate should be able to make a fair estimate of his eligibility after studying this bulletin.

The secretary cannot and will not make any eligibility rulings. These are made only by the Credentials Committee after reviewing those applications only, which are made on the special form provided for this purpose, and submitted to the secretary with the candidate's application fee.

All candidates must comply with board regulations in effect for the year in which the examination is taken, regardless of when the original application was filed.

Applicants declared ineligible for admission to examination may reopen their applications within two (2) years of the filing date without payment of an additional application fee.

Applicants declared eligible but who fail to exercise the examination privilege within three (3) years of the date of filing the application are required to file a new application and to pay a new application fee.

An applicant in military service during the wartime national emergency and assigned to work in general surgery under conditions acceptable to the Credentials Committee may receive credit up to a maximum of six (6) months applicable toward his three (3) required years of specialty training. The additional time may be applied toward the years of practice requirement.

An applicant serving under military orders in an Army or a Navy hospital in an obstetrical and/or gynecological service under supervision will be given the same credit as if he were working under a preceptor, since most of these departments are supervised by men who are Diplomates of this board or who are recognized obstetrician-gynecologists. He may obtain full residency credit if such hospital is officially approved and listed for residency training in this specialty.

Additional time in military service with any type of general medical assignment may be applied toward the board's year of practice requirement. The Credentials Committee of the board will review and give consideration to each individual case.

Upon notice of acceptance for admission to examination, examination fee is due and also case records which should be shipped by the candidate to the secretary's office as soon as possible and not later than the date of the Part I written examination.

The candidate should make immediate acknowledgment of his notice of acceptance at which time he will notify the secretary's office approximately when to expect his case reports.

EXAMINATIONS

Part I examinations are scheduled annually for the first Friday in February. Grades cannot usually be mailed from the secretary's office until after April first following the examination. Arrangements will be made for candidates to report in any convenient city where there may be a Diplomate of this board to conduct or to supervise the written examination which will be sent out from the board's office under sealed cover.

Special arrangement will be made through senior officers for conducting the written portion of the Part I examination for men in military service. Such candidates are requested to keep the secretary's office informed at all times of changes in their mailing addresses.

All applicants accepted for examination will be required to obtain a passing grade in both the written examination and a review of case reports (Part I), before becoming eligible for the oral-clinical and pathology examinations (Part II).

The passing grade for the written examination and case reports is 75 per cent. A candidate whose grade in either or both falls below 75 per cent is conditioned.

Reexamination for the removal of conditions in Part I may be taken after one year but within three years after the first failure, without payment of an additional fee.

Candidates who successfully complete the Part I examination proceed automatically to the Part II examination held later in the year.

Candidates appearing for reexamination under a new application after two previous failures will not be required, if they have passed all or part of the Part I examinations on their first application, to repeat such examination items already successfully cleared.

After two ineligibility or postponement rulings on any candidate's application, an entirely new application form must be submitted (with or without fee, according to current requirements) in order to bring data down to date. The essential feature of this should be evidence of additional training and experience.

All original Group A candidates, who have allowed three years or more to elapse without taking examinations, and who care to apply again, must do so on the regular current basis. If accepted, they will now be subject to Part I and Part II examinations.

Former Group A candidates appearing for reexamination after first failure in Part II are not required to take the Part I examination.

Part I

Examination consists of:

1. A comprehensive written examination, conducted annually, including questions on both obstetrics and gynecology and related basic sciences.
2. The filing of twenty-five (25) obstetrical and gynecological case reports, in condensed form. Five (5) cases may concern major illnesses, not necessarily operative. These must be cases for which the candidate was personally responsible.
3. The written examination will be limited to a maximum period of three hours.

Part II

The oral-clinical and pathology examinations given all candidates are conducted by the entire board and the associate examiners usually near the time and place of the annual meeting of one or more of the national societies represented on this board, usually that of the American Medical Association. Advance announcements of examination dates and place will be made in medical journals throughout the country.

Examination consists of:

1. Oral examination before two to four examiners.

   An endeavor is made to adapt the details of the oral examination to each candidate's experience and practice. The examination is particularly directed to ascertain his familiarity with recent obstetrical and gynecological literature, the related basic sciences, the breadth of his clinical experience, and his general qualifications as a specialist in obstetrics and gynecology.

2. Pathology examination.

   The candidate is expected to identify and to discuss several obstetrical and gynecological pathologic specimens and sections.

Examiners report orally on each candidate to the assembled board, after which the results of their investigations are considered jointly by the entire board and associate examiners. After a general consideration of the details of the candidates oral and pathology examinations, including a review of his capability and general adaptability, the candidate is passed or failed by the entire board.

The final action of the board is based upon the candidate's ethical and professional record, training and attainments, as well as on the results of his formal examination.

No conditions are given in Part II of the examination. When a candidate fails in Part II of the examination, he is not required to repeat Part I, but to take a reexamination in the oral-clinical and pathology portions only. One reexamination may be taken within three (3) years of the original examination or first failure without reapplication or payment of an additional fee.

The candidate may reappear at the examination following the one failed by him. In applying for reappearance he should outline additional training or experience acquired in the interim. The board may, at its discretion, deny the candidate the privilege of reexamination.

Failure to exercise the privilege of reexamination within three (3) years, entails the filing of a new application with the usual application and examination fees.

After two failures in either Part I or Part II on the first application, the candidate may reapply and be readmitted to examinations once only. Exceptions to this ruling can be made only by action of the entire board in annual session, usually to be based upon evidence of additional training and experience sufficient to warrant such action.

CASE REPORTS

Case reports are to be sent by the candidate to the secretary as soon as possible after receiving notification of eligibility, and not later than the date of the Part I written examination.

Twenty-five (25) important obstetrical and gynecological case reports, in condensed form, are required. Five (5) cases may concern major illnesses, not necessarily operative. These reports must include a variety of material rather than a number of cases of one type and must be cases treated within four (4) years of the date of the candidate's application. The number of cases from one's residency service should not be more than half the total number.

These reports are not to be copied verbatim from hospital records, but must be sufficiently complete so that the examiners can evaluate the judgment of the candidate in his choice of procedure.

Candidate should indicate on each case record whether this is from his residency service or from his private practice and all records failing to have this information will be considered unacceptable.

These reports should be prepared in condensed form in line with the following items:

1. Heading each separate case report must be the hospital number and date, name of the hospital at which the patient was operated on, with all pertinent dates, together with the candidate's name or identifiable initials, name of each patient, name of operator (candidate). The case reports should be given sequence numbers from 1 to 25 and must specify whether from residency service or from private practice.
2. (*a*) Preoperative diagnosis and basis for this, in brief.
   (*b*) Postoperative diagnosis, based on findings.
3. Nature of operation, omitting descriptive technical details, but including pathologist's findings on tissue removed.
4. Critical summary or analysis of each case, with critical deductions derived from correctness or incorrectness of diagnosis, operative findings, postoperative course, and from final results on discharge from hospital and at six months "follow-up" examination.
5. Histories must be typewritten on standard size paper, 8½ x 11 inches, and must be assembled by individual cases.
6. Reports must not be bound with any form of binding other than light weight paper folders or covers.
7. Two (2) separate verified index lists of case reports must be made for each individual hospital at which operations were performed. All verifications must be formally signed by the responsible hospital official, attesting in each instance that the candidate was the operator and must state:

   Sequence numbers of case reports.
   Candidate's name at head of each page.
   Name and address of hospital.
   Whether from residency service or from private practice.
   Patients' names or identifiable initials.
   Patients' admission numbers.
   Date of each patient's admission.
   Date of each patient's operation.
   Date of each patient's discharge.

The critical summary or analysis which must be prepared for each case must include:

1. An account of the candidate's personal observations of the case both prior to and subsequent to operation.
2. The basis for the diagnosis.
3. The facts that determined the course of treatment. Details of operative technic should not be included.
4. Critical conclusions to be drawn from the outcome of the case.

Case reports which do not include such discussion and comments will not be reviewed or graded by the examiners.

Obstetrical case reports should show:

(*a*) Date of first prenatal visit and any special features bearing on the case.

(*b*) The weight and condition of the child at birth and at time of discharge from the hospital.

Obstetrical reports which do not include pelvic measurements either by calipers and, as indicated, by x-ray pelvimetry, will be considered incomplete.

For lists of certificate holders, of this, as other boards, consult the Directory of Medical Specialists (1946).

Make checks payable to the American Board of Obstetrics and Gynecology.

Communications should be addressed to the secretary.

AMERICAN BOARD OF OPHTHALMOLOGY

Everett L. Goar, Chairman, Houston, Texas.
Georgiana D. Theobald, Vice Chairman, Oak Park, Ill.
S. Judd Beach, Secretary-Treasurer, 56 Ivie Road, Cape Cottage, Maine.
Conrad Berens, New York.
Frederick C. Cordes, San Francisco.
John H. Dunnington, New York.
Robert J. Masters, Indianapolis.
Cecil S. O'Brien, Iowa City.
M. Hayward Post, St. Louis.
Algernon B. Reese, New York.
Phillips Thygeson, San Jose, Calif.
Derrick T. Vail, Chicago.

ORIGIN, AIMS AND METHODS

In 1913 the American Ophthalmological Society, the Section on Ophthalmology of the American Medical Association, and the American Academy of Ophthalmology and Otolaryngology appointed committees to report on ophthalmic education.

In 1914 these committees recommended that medical schools of the first class establish graduate courses in ophthalmology leading to an appropriate degree, and that these courses should represent not less than two years of systematic work subsequent to taking the degree of Doctor of Medicine. There was unanimous agreement as to the need of systematized and standardized training of those who are to practice ophthalmology, but it was clear that, in the near future, the number who would take the complete course leading to such a degree would be small. Moreover, such a course would not solve the problem of differentiating, in some degree, between the competent and the incompetent among those now in practice of ophthalmology. The committees were continued and, in 1915, they made further recommendations, as a result of which a joint board was created consisting of three representatives from each of the three special societies.

In 1916, after much preliminary work, this board was organized as the American Board for Ophthalmic Examinations (later changed to "American Board of Ophthalmology"). It was incorporated May 3, 1917.

In 1934 the plan of organization was changed so that each component society elects four members, instead of three, to form the board. The members of this board are chosen in the same manner in which the presiding officers of these societies are selected. One is elected each year by each of the societies which are represented on the board, to serve for a four-year term.

As other specialties formed boards similar to the American Board of Ophthalmology the need for some supervising and coordinating control led to action by the American Medical Association in 1933 authorizing the Council on Medical Education and Hospitals: (1) to formulate standards of administration, based on those of the American Board of Ophthalmology, of Otolaryngology, of Obstetrics and Gynecology, and of Dermatology and Syphilology; and (2) to recognize officially new boards meeting these standards.

The Constitution of the Advisory Board for Medical Specialties which was organized in 1934 states that: "This Board shall act in an advisory capacity to such organizations as may seek its advice concerning the coordination of the education and certification of medical specialists."

The Advisory Board adopted June 10, 1934, a list of essentials for approved special examining boards. It is practically identical with the outline of essentials for approved specialty boards adopted June 10, 1934 by the Council on Medical Education and Hospitals and ratified June 11, 1934, by the House of Delegates of the American Medical Association.

PURPOSES OF THE BOARD

1. To elevate the standards of ophthalmology.
2. To determine the competence of practitioners professing to be specialists in ophthalmology.
3. To arrange and conduct examinations to test the qualifications of candidates who appear before the board for certification as specialists in ophthalmology.
4. To grant and issue certificates of qualification as specialists in the field of ophthalmology to candidates successful in demonstrating their proficiency.
5. To act as advisers to prospective students of ophthalmology.
6. To serve the public, hospitals and medical schools by preparing lists of specialists certificated by the board.

NO DEGREES OR LEGAL RESTRICTIONS

Each certificate granted or issued does not of itself confer or purport to confer on any person any degree or legal qualifications, privileges or license to practice ophthalmology, nor does the board intend in any way to interfere with or limit the professional activities of any duly licensed physician. Its chief aim is to elevate the standards of qualification for specialists in ophthalmology and to certify as specialists Doctors of Medicine who appear before the board for such recognition and certification, according to its requirements and regulations.

VALUE OF CERTIFICATE

Up to January 1, 1947, eighty-six examinations have been conducted and 2564 ophthalmologists have received the certificate of the board.

The American College of Surgeons recognized the certificate of this board as evidence of academic fitness in ophthalmology. Diplomates of this board applying for membership in the American College of Surgeons may be exempted from presenting case reports or be required to present half the customary number.

Many special eye hospitals as well as general hospitals in all parts of the country require the certificate for appointment or promotion on their staffs. In addition, many societies now require the certificate as a prerequisite for membership. The number of institutions and societies which require the certificate of the board is increasing.

Lists of those holding certificates from this board are published in the Directory of Medical Specialists; similar lists also appear in the American Medical Directory. This latter indicates diplomates of this and other boards by means of numerical symbols appearing in the biographic records, but does not give such special recognition to diplomates who are not members of the American Medical Association.

REQUIREMENTS

All candidates must comply with current board regulations regardless of time of filing application.

The secretary is not permitted to make decisions as to requirements. These rulings are made only by the Committee on Credentials after reviewing the candidate's formal application.

PREREQUISITES

1. High ethical and professional standing.
2. Full citizenship in the country where the candidate practices. (Limited to countries of North and South America, their possessions and territories.)
3. A degree from a medical school of high standing, satisfactory to the board and approved by the Council on Medical Education and Hospitals of the American Medical Association. An applicant whose training has been received outside of the United States and Canada, must present credentials satisfactory to the board and is required to have the certificate of the National Board of Medical Examiners if he has been in practice less than ten years.
4. Completion of an internship of not less than one year in a hospital approved by the same Council.
5. Not less than thirty-six months (a total of sixty months is required of candidates practicing both ophthalmology and otolaryngology) of combined study, training and practice of ophthalmology in approved medical schools, hospitals, clinics, dispensaries, laboratories, preceptorships and private practice.

GENERAL REQUIREMENTS FOR ALL CANDIDATES

1. Application forms must be filled out completely and accurately. Letters of endorsement, together with any other required credentials, must be sent to the secretary's office before the deadline date.
2. Fee of $100 remitted with application.
3. A list of papers or books published.
4. Preliminary conference.
5. Practical examination.
6. Special review of ophthalmic surgery.
7. Membership in the American Medical Association, or such other societies as are recognized for the purpose by the Council on Medical Education and Hospitals of the American Medical Association.

FEES

For preliminary conference and original examination, $100 (as mentioned above).

For reexamination in all subjects, $75.

For reexamination in one or more subjects, $35.

Examination must be taken within three years of date of application. Thereafter new application and fee are required.

The fees have been carefully computed on a basis of cost of examinations, and are used entirely for administrative expenses. Examiners serve without compensation other than actual expenses.

SPECIAL TRAINING

(Applicable so far as practicable after 1947)

This shall include:

1. Graduate study of the basic medical sciences which are fundamental to the intelligent practice of ophthalmology, particularly: anatomy, histology, embryology, optics, physiologic optics, visual physiology and psychology, pathology, bacteriology, pharmacology, disorders of ocular motility and binocular vision, perimetry, and in the skilful adjustment and use of instruments such as the ophthalmoscope, retinoscope, slit lamp and microscope. Mere factual knowledge is not sufficient; the candidate must have had training in the application of these subjects and in their use in clinical ophthalmology, especially in refraction.

2. Active clinical experience in approved hospitals, clinics, dispensaries and private practice. Library and laboratory facilities should be utilized for the intensive study of cases.

The subject matter to be covered under 1 and 2 is outlined in the syllabus prepared by the board.

These requirements may be met in various ways:

BASIC STUDIES

1. Histology, pathology, bacteriology, immunology.
2. Anatomy and embryology.
3. Perimetry.
4. Therapeutics and operations.
5. Optics and visual physiology.
6. Relation of the eye to general diseases.

These may be covered by:

A. *Graduate Study.*—By a curricular course in the basic sciences related to ophthalmology in an approved graduate medical school.

B. *Postgraduate Study.*—By courses in individual basic sciences related to ophthalmology as given at various approved institutions. The Home Study Course of the American Academy of Ophthalmology and Otolaryngology available to residents is recommended.

C. *Residency.*—By advanced study of these subjects during a residency and by correlation of the principles involved with clinical problems.

D. *Research, Fundamental and Clinical.*—By the detailed study, under supervision or as assistant to an experienced research worker, of some problem or topic which brings the basic sciences into direct relation with the concrete clinical problem.

CLINICAL EXPERIENCE

A. By residency in an approved hospital. The most desirable of these residencies have regular lectures covering the entire field of clinical ophthalmology and of the basic subjects as applied in clinical practice. Many of these have seminars at which residents report cases which they have carefully worked up. These are discussed by the other residents and by the staff and the method of presentation as well as the subject matter critically considered.

B. By residencies in hospitals where regular instruction by lectures and quizzes and seminars is not available. The syllabus issued by the board will guide the resident in his selection of topics to be studied.

C. By fellowships in ophthalmology.

D. By preceptorship with a well-trained and critical ophthalmologist.

E. After completing a residency it is of great advantage to secure a position in a clinic as fellow or assistant. This may require only part time work, but due credit will be given. Its value to the student depends on how much study he puts into it and on how competent his seniors are.

F. Research under competent critical and sympathetic supervision will give first hand insight into (1) the methods whereby old knowledge was and new knowledge is acquired and (2) the pitfalls which accompany attempts to enlarge the sphere of knowledge. Only in this way can the candidate evaluate basic facts in the intelligent critical way which is expected of the specialist in practice.

G. The candidate who cannot secure the type of residency he desires should not despair, for his progress depends far more on how he used his opportunities than on the opportunities themselves.

PRELIMINARY CONFERENCE

Preceding each examination the candidates are required to present themselves before members of the board to demonstrate their fitness for examination. Their training and experience will be reviewed together with their understanding of the basic sciences related to ophthalmology. Those who are found acceptable will then be notified to appear immediately following the conference for a practical and clinical examination in ophthalmology.

EXAMINATIONS

Examinations will be held annually at or near the time and place of the meeting of the American Medical Association; also at other times and places at the discretion of the board, depending on the number of applications from any region.

The board reserves the right to limit the number of candidates to be admitted to any one examination.

Candidates must be examined in all subjects covered by the Syllabus of the board. The time spent in preparation will count less than the knowledge and experience acquired as shown on examination.

PRACTICAL AND CLINICAL EXAMINATION

The subjects of the practical examination are as follows: External Diseases, Ophthalmoscopy, Histopathology, Refraction, Motility, Ophthalmic Surgery, Perimetry.

1. *External Diseases of the Eye and Adnexa.*—Various methods of examination, diagnosis and treatment.

2. *Ophthalmoscopy.*—Patient will be examined by the candidate and the findings described or drawn. A candidate is required to bring his own ophthalmoscope.

3. *Pathology.*—The candidate will demonstrate familiarity with general clinical pathology as well as the etiology, pathology and bacteriology of diseases of the eye. He will be asked to examine microscopic slides and to recognize normal and pathologic histology of the eye.

4. *Refraction.*—A candidate will examine patients and show mastery of various methods, and of the principles of refraction and of retinoscopy. He should bring his own retinoscope.

5. *Motility.*—The candidate will demonstrate on patients his familiarity with routine methods of examination and diagnosis.

6. *Ophthalmic Surgery.*—A candidate will demonstrate his surgical technic on animal eyes. He must bring his own equipment for performing an extra-capsular combined extraction of the lens.

Special Review of Surgical Cases. The board now requires of all candidates a list of ophthalmic operations performed within two years prior to examination. This list is to be presented with application.

The operations should be listed in groups of each type of surgery. The numbers of operations in each group must be totaled and the total number of all operations shown. The list must contain the following data:

(*a*) Date.

(*b*) Condition or conditions for which operation was performed.

(*c*) Name and character of operation.

(*d*) Identification by hospital or clinic number, or the name of a consultant or confrere who was present at the time of operation.

Circumstances which prevent any candidate from fulfilling this requirement should be fully explained, with detailed statement of candidate's surgical experience.

CERTIFICATION

The decision of the board is final as to the candidate's passing, failure or partial failure. The final action of the board is based upon the candidate's ethical and professional record, training and attainments, as well as on the results of his formal examinations.

Certified ophthalmologists should refer to themselves as DIPLOMATES of the American Board of Ophthalmology. (There are only twelve *members* of the board and these are elected from the three component societies.)

REEXAMINATION

Candidates may be reexamined as often as they desire on satisfactory evidence of adequate additional preparation and payment of reexamination fee. A minimum of one year must elapse between examinations when a candidate is conditioned in one or more subjects. A minimum of two years additional preparation is required of candidates who fail in all subjects. The board may, at its discretion, deny the candidate the privilege of reexamination.

REVOCATION OF CERTIFICATES

Each Certificate of Qualification may be revoked by this board in the event that:

1. Any representation or statement made to the board or to any of its representatives by the physician so certified, including the statements contained in his application for certification, shall have been false or intentionally misleading;

2. The physician so certified shall not in fact have been eligible to receive certification, irrespective of whether or not the facts constituting such ineligibility were known to or could have been ascertained by this board, its members, directors,

examiners, officers or agents at or before the time of issuance of such Certificate of Qualification;

3. Any rule governing examination for certification shall have been violated by the physician so certified and the fact of such violation shall not have been ascertained until after the issuance of the Certificate of Qualification;

4. The physician so certified shall violate the standards of ethical practice of medicine then accepted by organized medicine in the locality in which he shall be practicing; the forfeiture, revocation of suspension of his license to practice medicine; the expulsion from, or suspension from the rights and privileges of membership in any recognized medical society;

5. The physician so certified shall fail to comply with or violate, or if the issuance or receipt by him of such Certificate of Qualification shall have been contrary to or in violation of, the Certificate of Incorporation, the By-Laws or the Rules and Regulations of this board.

The American Board of Ophthalmology considers it unethical for physicians to divide fees, to pay commissions to any persons referring cases to them, and to accept commissions or rebates from any opticians, druggists, or makers of appliances in any way connected with the medical care of the patient.

Upon revocation of any Certificate of Qualification by this board as aforesaid, the holder thereof shall return his Certificate of Qualification and all other evidence of certification to the secretary of the board and his name shall be removed from the list of diplomates or Certificate holders of this board.

For complete lists of diplomates consult the Directory of Medical Specialists published by the A. N. Marquis Company, 210 E. Ohio Street, Chicago 11, Illinois.

Address all communications to the Secretary-Treasurer.

AMERICAN BOARD OF ORTHOPEDIC SURGERY

Fremont A. Chandler, Chicago.

INTRODUCTION

The tendency of an increasing number of physicians to limit heir practice to a special branch of medicine has made it essential that the various recognized specialties organize qualifying boards to certify applicants who prove themselves competent. Recognizing this need, three major orthopaedic groups, viz., The American Orthopaedic Association, The Section on Orthopaedic Surgery of the American Medical Association, and the American Academy of Orthopaedic Surgeons, united in organizing a certifying board. This board was ncorporated in the year 1934 as The American Board of Orthopaedic Surgery, Inc., and is officially approved by the Advisory Board of Medical Specialties and by the Council on Medical Education and Hospitals of The American Medical Association.

It is the purpose of the board to raise the qualifications and standards for the practice of orthopaedic surgery and to certify those surgeons who voluntarily comply with its requirements.

WHAT THE BOARD WILL ACCOMPLISH

1. Certification by the board will form a criterion by which interested lay and professional groups may judge the qualifications of an orthopaedic surgeon and will be a reliable guide in the choice of consultants.

2. Qualification of applicants for certification by the board indirectly results in improved teaching of orthopaedic surgery in medical schools and better care of patients on orthopaedic services of hospitals that have approved resident training programs.

Excerpts from Articles 1, 2, 7, 8, 9, 10, 11 and 12 of the By-Laws:

Article 1. *Section 1.* Definition. Orthopaedic surgery is that branch of surgery especially concerned with the preservation and restoration of the functions of the skeletal system, its articulations and associated structures.

Article 2. *Section 2.* Purposes. To test and determine the qualifications of applicants for examination and to issue certificates to those found qualified.

Section 3. To prepare and maintain a registry of the holders of the certificates issued by the board.

Section 4. To serve the public, physicians, hospitals and medical schools by furnishing lists of those who have received the certificate of the board, and thus to assist in protecting the public against irresponsible and unqualified practitioners who profess to specialize in orthopaedic surgery.

Article 7. Qualification of Candidates. There are certain general qualifications applicable to all candidates for examination Part I and Part II. In addition, candidates must have had special training in orthopaedic surgery on one of the approved plans hereinafter described:

Section 1. General Qualifications:

(a) He must be a citizen of the United States or Canada.

(b) He must be a graduate of a medical school approved by the Council on Medical Education and Hospitals of the American Medical Association. In the case of an applicant whose training has been received outside the United States or Canada, his credentials must be satisfactory to the Council on Medical Education and Hospitals of the American Medical Association and to the National Board of Medical Examiners; he must have engaged in the practice of orthopaedic surgery in the United States or Canada for at least three years prior to submission of his application.

(c) He must have served an internship in a general hospital acceptable to this board. Beginning in 1951 and thereafter, applicants for Part I of the examinations must have had a year of surgery in addition to their internship.

(d) He must be duly authorized to practice medicine in the state or province of his residence.

(e) He must be ethical and have good professional standing.

(f) He must be a member of the American or Canadian Medical Association before he can be declared as eligible for Part II of the examinations.

Section 2. Special Qualifications: The trainee should realize that preparation for the specialty of orthopaedic surgery should include a sound knowledge of anatomy, pathology, physiology, bacteriology and biochemistry as these basic sciences apply to orthopaedic surgery. In addition he should have observation and first hand experience in the diagnosis, treatment, operative and postoperative care of recent and old fractures and other orthopaedic problems of adults and children. However, when so desired the trainee may substitute additional experience in fractures and adult orthopaedics for the work in children's orthopaedics as outlined in subsequent paragraphs.

Many hospital services approved for orthopaedic training have all phases represented in such proportion that they can be given concurrently over a three year period and provide a well balanced program. Such a plan of training is probably the most desirable. However, it is possible for one to obtain satisfactory training by taking various phases of the work in different institutions (matched training). In order to help the trainee plan a well balanced program of matched training the board suggests that it be arranged as follows: adult orthopaedics, one year or one third of the training period; fractures, six months or one sixth; basic sciences, six months or one sixth and children's orthopaedics, one year or one third, (as previously indicated a second year of fractures and adult orthopaedics may be substituted for the year of children's orthopaedics).

The clinical phases of training may be obtained in hospitals or under preceptors where adequate facilities are not available for instruction in the basic sciences. In such cases the trainee should spend at least six months in the graduate department of a medical school which can offer adequate facilities and instruction in these subjects.[1]

On completion of a year of internship and a year of surgery (the latter requirement being applicable to those who apply for Part I of the examinations in 1951 and thereafter), the trainee may take his special work in orthopaedic surgery by one of three plans: (1) Resident training on an orthopaedic service of a hospital approved by the Council on Medical Education and Hospitals. (2) Combined Resident Training and Assistantship. (3) Preceptorship.

(1) Resident Orthopaedic Training: The applicant should serve for three years as a resident in Orthopaedic Surgery on services approved by the Council on Medical Education and Hospitals. When taken as matched training, each of the required phases should be taken on a service approved for that particular phase and all phases must be covered. If the trainee elects to substitute additional adult orthopaedics and fractures for a year of children's orthopaedics, the training that is substituted must be acquired on an approved orthopaedic service

---

[1] Further suggestions relating to basic science training and details concerning requirements for approved plans of resident training are published in a pamphlet which may be obtained from the secretary of the board.

and the total period of resident training must be three years. The type of credit available in various institutions is indicated by the symbols "A," "C," "F" and "S" in the lists of approved residencies published by the Council on Medical Education and Hospitals.

(2) Combined Resident Training and Assistantship: In special instances, with the prior approval of the Committee on Resident Training, the board will recognize for not over two years of training in orthopaedic surgery, periods of training in which the candidate combines work as *resident* on a hospital service, with part-time assistantship to an orthopaedic surgeon certified by the American Board of Orthopaedic Surgery, provided that the major part of his time is spent by the candidate in the hospital service.

(3) Preceptorship: In certain instances, the board may recognize training under the preceptorship plan. Before taking training under a preceptor, the applicant must have completed an internship and a year of surgery. The preceptor must be a diplomate of the board whose clientele is large enough to give the trainee experience in all phases of orthopaedic work. The trainee will be required to serve as *full time assistant* for five years and during this period the preceptor should devote special periods of time each week, outside of the routine hours employed in the hospital and office practice, to assist the trainee with organized courses of study similar to those covered during resident training. If facilities and instruction in the related basic sciences are not available, the trainee should spend at least six months of this five year period as a student in a recognized graduate medical school where these subjects can be provided. On completion of the five years under a preceptor, the trainee should engage in practice, limited to orthopaedic surgery, either alone or associated with a diplomate, for a further period of five years, before becoming eligible for Part II of the examinations.

Section 3. Practice Requirement: These requirements are intended not only to test the applicant's determination to practice in an ethical manner and limit his practice to the special field of orthopaedic surgery, but also his ability to increase his scientific knowledge. Prior to making application for Part II, applicants who took training as residents on approved orthopaedic services, should have had at least two years of experience in practice limited to the field of orthopaedic surgery. Applicants who had preceptorship training, must have had five years of practice limited to the specialty. Applicants who did not take children's orthopaedics, but substituted adult orthopaedics and fractures instead, must have limited their practice to the same field in which they were trained.

Section 4. Credit for Services with the Armed Forces: Because in some instances applicants who served with the Armed Forces acquired good training in orthopaedic surgery, credits up to a maximum of two years, may be allowed. Such credit, however, may be granted only on presentation of evidence that such service is, in the opinion of the Committee on Eligibility, equivalent to similar periods of approved resident training. Those requesting credits for training acquired while in the service, should submit their completed Record of Professional Assignments with their application.

(a) A year of orthopaedic experience with the Armed Forces, when approved by the Committee, *may* be accepted to replace one of the three required years of orthopaedic training.

(b) A second year of orthopaedic service with the Armed Forces may be credited as a year toward the practice requirement.

(c) Credit for military service will be considered for assignments covered between January 1941 and July 1946.

Article 8. *Section 1.* Examinations. Application for examination: Applications for examinations, Part I and Part II, shall be filed with the secretary upon the prescribed forms and shall be accompanied by the prescribed fees which the board may fix from time to time. The required data shall be entered in *typewritten* form and the application must be accompanied by an unmounted *autographed* recent photograph of the applicant. The names of two diplomates of the board shall be supplied by the candidate for reference.

The completed application must be filed with the secretary at least 60 days prior to date set for examination.

The data submitted in each application must be checked and verified in the offices of the American Medical Association.

Letters of reference shall be obtained by the secretary from diplomates whose names have been submitted by the applicant. Additional information may be sought from other available sources.

If an application has been approved, the candidate will be notified by the secretary and should then forward the required fee for the examination, Part I or Part II, as the case may be.

Section 2. Committee on Eligibility: A committee of three members from the board, to be designated the "Committee on Eligibility," shall meet with the secretary at least thirty days prior to the examination and review the data submitted in each application. They shall determine whether or not the applicant has fulfilled the requirements specified by the board for practice of the specialty. This committee shall have the authority to approve or reject the applicant and shall direct the secretary to give him written notice of their decision. No applicant shall be rejected except when the committee as a whole has reviewed his data and has voted unanimously that he is not qualified for the examination. If the rejection is based on inadequate training, the committee shall indicate the additional training that will be required. When applications for Part I of the examination are reviewed, the committee can on request of the applicant, designate the amount and character of additional training that he should take to qualify for Part II.

Section 3. Advisory Committee of Service Consultants: The Committee on Eligibility shall be privileged to form an Advisory Committee of Service Consultants to consist of diplomates who served as Orthopaedic Consultants in the various divisions of the Armed Forces during World War II. This committee, or any of its members, may be called on to assist in evaluation of orthopaedic training obtained by an applicant while serving with the Armed Forces.

Section 4. Examinations: Applicants for certification will be required to take the examination of the board in *two* parts. No applicant *shall be permitted to take both parts of the examination at the same time, nor can he be permitted to take Part II until he has successfully passed Part I.* These may be held in different places and on different dates to meet the needs and convenience of candidates and board members. Announcement of the time and place for examination will be made through the medical journals.

(1) Examination Part I

A committee of three members of the board shall be appointed by the president and shall be charged with the responsibility for setting the dates and places for examination, securing additional examiners to assist in the work, formulating the program of subjects and interviews for the oral quizzes, and providing questions for the written examination. This committee will likewise be responsible for the arrangements at each place the examination may be held.

(2) Examination Part I

(a) Eligibility for Examination Part I: Minimum requirements for eligibility for examination, Part I, shall consist of completion of an internship (and a year of surgery effective for Part I in 1951), followed by at least a year of resident training in orthopaedic surgery on an approved service.

Applicants who have completed more than this minimum requirement are eligible for Part I at any time up to completion of their full requirements; however, candidates who are fully qualified must submit application for Part I and successfully pass this examination before submitting application for Part II.

Candidates who make application based on preceptorship training will be considered by the Committee on Eligibility on completion of an internship and a year of resident training in surgery, followed by five years as a full time assistant under a preceptor who is a diplomate of the board.

(b) Examination, Part I: This part shall consist of a written examination and oral interviews covering those parts of anatomy, pathology, physiology and biochemistry related to surgery and orthopaedics. In addition there will be questions on fundamental surgical principles, elementary fractures and orthopaedic procedures, history-taking and physical examination.

(3) Examination, Part II

(a) Eligibility for Examination, Part II: Candidates applying for examination, Part II, must have successfully passed Part I and must have completed the prescribed training and practice periods, as defined in Article 7, Section 2.

A separate application for Part II must be completed and forwarded to the secretary, together with the required application fee, at the specified time.

(b) Examination, Part II: This part of the examination will be given in only one city once each year. It will consist of oral quizzes and a written examination covering the advanced work in all phases of orthopaedic surgery. The oral examinations will include an interview in anatomy, pathology, fractures, congenital and acquired deformities, static and postural defects and other orthopaedic subjects.

(c) Applicants who have qualified with a year of children's orthopaedics will have separate written and oral questions related to this phase of orthopaedic surgery.

In certain instances, on recommendation of the Committee on Eligibility a representative of the board may be requested to make a visit of inspection to review the applicants' work in his own community. In other instances, the committee may require the candidate to submit copies of complete records of twenty-five major surgical cases and abstracts of an additional twenty-five cases.

(4) Examinations Grades

The written examination shall represent 50 per cent of the total grade and each of the five oral interviews shall represent 10 per cent of the grade. The grades on oral interviews shall be entered by each examiner immediately at the close of the interview.

The written examination shall be graded by board members and every paper falling below the passing mark must be reviewed by two additional examiners. After the grades are totaled, they shall be reviewed by the board as a whole and the individual grades of each candidate who has failed shall be thoroughly reviewed and discussed. No candidate shall be notified of failure except with the unanimous consent of the entire board.

(5) Re-examination

An applicant who fails to pass Part I or Part II of the examinations may be re-examined a second and third time in each part by paying the prescribed examination fee each time he is re-examined. Additional *application* fees are *not* required for re-examination. The applicant who fails must appear for his second or third re-examination within three years after the first failure. After three years a new application with the appropriate fee must be submitted.

After three successive failures in Part I or Part II of the examinations the applicant must have had additional graduate training in orthopaedic surgery before submitting a new application.

Article 9. *Section 1.* Certification: When an applicant has successfully passed Part II of the examinations he shall be entitled to a certificate of the board. This certificate shall state that he has been found by this board to be qualified to practice the specialty of orthopaedic surgery. The certificate shall be issued in such form as may be adopted by the board and shall be signed by the officers and members of the board.

Section 2. No certificate will be issued to candidates who have only successfully passed Part I of the examinations but they will be given due notice by the secretary in writing that they have passed the examination.

Section 3. An up-to-date listing of all those who have been examined and certified by the board, shall be prepared annually by the secretary and copies shall be mailed to each diplomate. Those whose training includes a year of children's orthopaedics shall be indicated in these listings by an appropriate symbol.

Article 10, *Section 1.* Seal. A seal containing the words and numerals "American Board of Orthopaedic Surgery, MCMXXXIV," around the outside with the words "Orthos and Pais" in Greek in the center with the word "Incorporated" above the center and the word "Delaware" below the center, is hereby adopted as the corporate seal.

Article 11. Standing Committees: There shall be three standing committees of the board and the vacancies that occur as a result of termination of service or resignation of members shall be filled by appointment by the president.

Each of these committees shall consist of three members.

The Committees are as follows:

(1) The Committee on Eligibility.
(2) The Committee on Examinations.
(3) The Committee on Resident Training.

Section 1. The Committee on Eligibility shall consist of three members whose duties are described under Article 8, Section 2.

Section 2. The Committee on Examinations shall consist of three members whose duties are described under Article 8, Section 4, (1).

Section 3. Because the Council on Medical Education and Hospitals requires that a committee from the board review and advise with it on applications for approval of resident training programs, the president shall appoint a committee of three board members to be known as the Committee on Resident Training. The secretary shall refer to this committee all questions relating to resident training and may call a meeting of the committee to confer with members of the Council from time to time as may be required. This committee shall also advise with the Joint Committee on Postgraduate Training from the American Orthopaedic Association and the American Academy of Orthopaedic Surgeons in regard to approval services and standards of training.

Article 12. *Section 1.* Amendments: These By-Laws may be amended, modified or repealed by the vote of at least five members at any regular or special meeting of the board; provided however, written notice of the proposed action stating the substance thereof shall have been given each member at least twenty days before the meeting.

TIMES AND PLACES FOR EXAMINATION

Examination, Part I, will be given probably during May of each year in various centers that will be designated by the board. The secretary will give applicants advance notice of the date, place and hour.

Examination, Part II, will be given in one place and probably not oftener than once each year. As a rule it will be in connection with the meeting of the American Academy of Orthopaedic Surgeons and will precede the meeting.

FEE SCHEDULE

(1) Application, Part I, fee $15.00, not returnable.

(2) Examination, Part I, fee $35.00, payable only by those approved by the Committee on Eligibility and forfeited if the candidate fails to appear for the next scheduled examination.

(3) Application for Part II, fee $15.00, not returnable.

(4) Examination, Part II, fee $35.00, payable only by those approved by the Committee on Eligibility and forfeited if the candidate fails to appear for the next scheduled examination.

(5) Re-examination. See Article 8, Section 4, (5).

This fee schedule effective as of January 19, 1946.

Address all communications to the secretary-treasurer.

AMERICAN BOARD OF OTOLARYNGOLOGY

OFFICERS OF THE BOARD

H. I. Lillie, President, Rochester, Minn.
Arthur W. Proetz, Vice President, St. Louis.
Dean M. Lierle, Secretary-Treasurer, University Hospitals, Iowa City.

SENIOR COUNSELORS

George M. Coates, Philadelphia.
Ralph F. Fenton, Portland, Ore.
Perry G. Goldsmith, Toronto, Canada.
Harris P. Mosher, Marblehead, Mass.
W. E. Sauer, St. Louis.
Burt R. Shurly, Detroit.

BOARD OF DIRECTORS

Louis H. Clerf, Philadelphia.
William E. Grove, Milwaukee.
Gordon F. Harkness, Davenport, Iowa.
Lyman H. Heine, Fremont, Neb.
Frederick T. Hill, Waterville, Maine
Gordon D. Hoople, Syracuse, N. Y.
Westley M. Hunt, New York.
Percy E. Ireland, Toronto, Canada.
Marvin F. Jones, New York.
Dean M. Lierle, Iowa City.
H. I. Lillie, Rochester, Minn.
Carl H. McCaskey, Indianapolis.
Bernard J. McMahon, St. Louis.
Philip E. Meltzer, Boston.
Werner Mueller, Boston.
C. Stewart Nash, Rochester, N. Y.
Arthur W. Proetz, St. Louis.
Robert F. Ridpath, Philadelphia.
LeRoy A. Schall, Boston.
Ernest M. Seydell, Wichita, Kan.
John J. Shea, Memphis, Tenn.
Frank R. Spencer, Boulder, Colo.
O. E. Van Alyea, Chicago.
Fletcher D. Woodward, Charlottesville.

ASSOCIATE DIRECTORS

Lawrence R. Boies, Minneapolis.
James H. Maxwell, Ann Arbor, Mich.

ORIGIN, AIMS AND METHODS

In 1916 the American Academy of Ophthalmology and Otolaryngology appointed a committee consisting of Drs. J. C. Beck, Thomas E. Carmody and John M. Ingersol to examine candidates in otolaryngology. The following year Drs. Harris P. Mosher, Ross Hall Skillern and Robert M. Lynch were added to the committee.

In 1924, through the efforts of Dr. George Shambaugh, Sr., the above committee was enlarged to include representatives from each of the following societies: The American Laryngological, Rhinological and Otological Society; The American Academy of Ophthalmology and Otolaryngology, and the Section of Laryngology, Otology and Rhinology of the American Medical Association. Each organization appointed two members, making a total of ten which constituted the first American Board of Otolaryngology. The original members were: Dr. J. C. Beck of Chicago; Dr. T. E. Carmody of Denver; Dr. T. H. Halstead of Syracuse, N. Y.; Dr. H. W. Loeb of St. Louis; Dr. R. C. Lynch of New Orleans; Dr. H. P. Mosher of Boston; Dr. B. R. Shurly of Detroit; Dr. R. H. Skillern of Philadelphia; Dr. F. R. Spencer of Boulder, Colorado, and Dr. W. P. Wherry of Omaha, Nebraska.

OBJECTIVES

The objectives of the American Board of Otolaryngology are to establish the qualifications for the practice of otolaryngology and to hold examinations and to certify those otolaryngologists whom the board finds qualified.

The Articles of Incorporation state the objectives of the board as follows: "The object of the corporation shall be to elevate the standards of otolaryngology, to familiarize the public with its aim and ideals, to aid in the protection of the public against irresponsible and unqualified practitioners, to receive applications for examination in otolaryngology, to conduct examinations of applicants, to issue certificates of qualification in otolaryngology as authorized by the board and to perform such acts as will advance the cause of otolaryngology.

REQUIREMENTS

The following qualifications are required by the board:

1. A candidate acceptable for the examination must have been a citizen of the United States (or Dominion of Canada) for at least five years, a graduate of a medical school approved by the Council on Medical Education and Hospitals of the American Medical Association, have had at least one year's general internship in an approved hospital (or its equivalent), and be of good moral character and ethical in his professional relations. Candidates from foreign countries must be permanent residents and citizens thereof, and meet the general requirements above.

2. A candidate must have membership in the American Medical Association, the Canadian Medical Association, or other medical societies of equal standing recognized by the Council on Medical Education and Hospitals of the American Medical Association.

3. Each candidate must have had acceptable training in the basic sciences which are fundamental to the intelligent practice of otolaryngology, including anatomy of the ear, nose, throat, neck, chest, esophagus and related nervous systems, pathology, bacteriology, physiology, didactic otolaryngology and fundamentals of surgery. This requirement may be met by its inclusion in resident training or by a formal postgraduate course.

4. (a) EFFECTIVE UNTIL 1950—a candidate must have completed a two years' residency in otolaryngology or a three years' residency in ophthalmo-otolaryngology and have restricted his practice to otolaryngology (or ophthalmo-otolaryngology) for a minimum of three years or four years respectively, which may include the period of training.

4. (b) EFFECTIVE AFTER JULY 1, 1950—candidates must pursue a course of three years' study in otolaryngology, or four years' study if ophthalmology be included (in which case there must be a minimum of 50 per cent spent in the study of otolaryngology). The three years may be spent in an approved residency of that duration, which residency may include study of the basic sciences as specified above, or the candidate may pursue a formal course in the basic sciences, and complete his training with a residency which will give him a total of three years' study in the specialty. In addition to the above, the candidate must have had a minimum of one year in practice limited to the specialty.

5. (a) EFFECTIVE UNTIL 1950—five years' practice limited to otolaryngology (or ophthalmo-otolaryngology) may be accepted in lieu of the requirements in section 4-a, subject to the approval of the Credentials Committee of the board.

5. (b) EFFECTIVE AFTER JULY 1, 1950—a candidate, in addition to the requirements in Nos. 1, 2 and 3, may qualify for examination if he has limited his practice to otolaryngology (or ophthalmo-otolaryngology) for six years.

6. Candidates who cannot meet all of the above requirements may be accepted for examination in exceptional circumstances but only upon the recommendations of the Credentials Committee.

7. A limited certificate in one of the subspecialties of otolaryngology may be issued at the direction of the board.

All candidates must comply with current board regulations, regardless of the time of filing application.

CREDIT FOR MILITARY SERVICE

The board will allow credit for one year restricted practice while in the armed forces. Further credit may be allowed at the discretion of the board, based on the merits of the individual case and governed by the authenticated medical officer's record.

APPLICATION AND FEES

1. Application must be made in duplicate on special blanks procured from the secretary. The completed application blank must be returned to the secretary, together with the other required credentials, 120 days in advance of the examination at which the candidate desires to appear.

2. The applications must be accompanied by two small photographs of the candidate, together with verification of the period of enrollment from the institutions where training in otolaryngology was obtained, and the names of two or more otolaryngologists, preferably diplomates of the board, from the vicinity of the candidate's place of residency, to be used as references.

3. The fee for the examination is $100, no part of which is returnable. Of this sum $25 must accompany the application. No application will be acted on until the $25 application fee is received. The balance of the fee—$75 must be paid to the secretary upon notification that the candidate has been accepted for examination and at least 90 days in advance of the date of examination. A reexamination fee of $50 is required of candidates conditioned in one or more subjects.

4. The fees have been carefully computed on a basis of cost of examinations and are used entirely for administrative expenses. Examiners serve without compensation other than actual expense.

5. The application remains valid for three years. An applicant must appear for examination within this time or forfeit the fee.

6. The board, acting as a committee of the whole, reserves the right to reject an applicant for any reason deemed advisable and without stating the same and the action of the board shall be final.

EXAMINATION

Examination will be held at such time and place as the judgment of the board may dictate. Advance notice of examinations will be given in The Journal of the American Medical Association and the several special journals devoted to otolaryngology. So far as is possible these will be held biannually at or near, the time and place of meeting of the American Medical Association, or special societies, and of the American Academy of Ophthalmology and Otolaryngology. The examinations cover from two to four days.

The type of examination is as follows:

(1) Clinical, covering the actual handling of patients, including history taking, physical and functional examinations, the use of laboratory and x-ray findings and a discussion of differential diagnosis.

(2) Didactic, oral examinations covering all phases of otolaryngology, including physiology.

(3) Gross and microscopic pathology.

(4) A written examination may be included when the board deems this advisable.

REEXAMINATION

A candidate who is conditioned in his examination may be admitted to a subsequent examination after one year and within the three-year period dating from his application on payment of an additional fee of $50 and 120 days' notice of intention to appear is required.

Candidates who have failed in the examination may be accepted for reexamination upon recommendations of the Credentials Committee. Satisfactory evidence of further study and progress will be required. A new application must be filed and accompanied by the regular fee of $25 and the balance of the fee—$75 will be due on notification of acceptance.

CERTIFICATION

1. A certificate granted by the board does not of itself confer or purport to confer any degree or legal qualifications, privileges or license to practice otolaryngology, nor does the board intend or attempt in any way to interfere with or limit the professional rights and activities of any duly licensed physician. Its aim is to improve the standards of practice of otolaryngology and to certify as specialists those who voluntarily comply with its requirements and regulations.

2. The final action of the board is based on the candidate's ethical and professional record, training and attainments, as well as on the results of his formal examinations.

REVOCATION OF CERTIFICATES

The certificates issued by the board are subject to the provisions of the articles or certificate of incorporation, the by-laws and action of the board, and each certificate is subject to revocation in the event that: (a) the issuance of such certificate or its receipt by the physician so certified shall have been contrary to any of the provisions of the certificate of incorporation or by-laws: or (b) the physician so certified shall not have been eligible to receive such certificate, irrespective of whether or not the facts constituting him so ineligible were known to or could have been ascertained by the directors of the board at the time of the issuance of such certificate: or (c) the physician so certified shall have made any misstatement of fact in his application for such certificate or in any other statement or representation to the board or its representative: or (d) the physicians so certified shall violate the standards of ethical practice of medicine or shall have been convicted by a court of competent jurisdiction of a felony or of any misdemeanor involving, in the opinion of the Board of Directors, moral turpitude in connection with his practice of medicine: or (e) the physician so certified shall have had his license to practice medicine revoked or shall have been disciplined or censured as a physician by any court or other body having proper jurisdiction and authority.

CANDIDATE'S PLEDGE

Candidates are required to sign the following pledge:

I HEREBY APPLY to the American Board of Otolaryngology for examination by the said board in accordance with its rules and herewith enclose the application fee of $25.00 which is not returnable. I understand that the balance of $75.00 is to be paid if and when accepted for examination and is likewise not returnable. I hereby agree that prior to an examination, or subsequent to my examination, the board may investigate my standing and reputation as a physician, including my reputation for complying with the standards of ethics of the profession, and may refuse to examine me, or, having examined me, may refuse a certificate and such refusal may be for any reason deemed advisable and without stating same, and any refusal to grant a certificate may not and shall not be questioned by me in any court or law or equity or other tribunal, or otherwise nor shall I have any claim of any kind in the event of such refusal nor shall I be entitled to a return of the fee accompanying the application. I further agree to be bound by the provisions of the articles of incorporation as amended from time to time and all by-laws whether now in force or hereafter enacted.

Address all communications to the secretary-treasurer.

AMERICAN BOARD OF PATHOLOGY

N. C. FOOT, President, New York.
F. WILLIAM SUNDERMAN, Vice President, Philadelphia.
ROBERT A. MOORE, Secretary-Treasurer, Washington University School of Medicine, St. Louis 10.
PAUL R. CANNON, Chicago.
R. PHILIP CUSTER, Philadelphia.
JOSEPH A. KASPER Detroit.
JAMES W. KERNOHAN, Rochester, Minn.
JAMES B. MCNAUGHT, Denver, Colo.
EDWIN W. SCHULTZ, Stanford University, Calif.
SHIELDS WARREN, Boston.

ORGANIZATION AND OBJECTIVES

In June, 1935, the Section on Pathology and Physiology of the American Medical Association and the American Society of Clinical Pathologists appointed committees which acted jointly in consideration of the feasibility and necessity of a national qualifying board. The joint committees agreed unanimously that such a board should be established and proceeded to draw up by-laws for such a board. In May 1936 the American Society of Clinical Pathologists and the Section on Pathology and Physiology of the American Medical Association accepted the proposed by-laws, authorized the nomination of four members each to the board and suggested incorporation in the state of Michigan. Approval of the board by the Advisory Board for Medical Specialties and the Council on Medical Education and Hospitals of the American Medical Association was given. On July 19, 1936, the organization of the board was carried out in Chicago.

Dr. Karsner of the American Medical Association Section and Dr. Foord of the American Society of Clinical Pathologists, whose terms on the board expired in 1938, were renominated by their respective organizations and were reelected by the board.

Dr. E. B. Krumbhaar, who had served as a member of the board since its inception, resigned in 1940, and his resignation was regretfully accepted. Dr. N. Chandler Foot of New York was elected by the board to fill Dr. Krumbhaar's unexpired term. Drs. Sanford and Lamb were renominated to the board by the American Society of Clinical Pathologists and Drs. Moore and Hartman were renominated by the Section on Pathology and Physiology of the American Medical Association.

At the fall meeting in 1942 two new members, Dr. Paul R. Cannon, Professor of Pathology at the University of Chicago, and Dr. Robert A. Moore, Professor of Pathology of Washington University, St. Louis, were elected to the board under the provision that trustees at large could be elected at the discretion of the board itself. These new members, representing as they do the younger group of professors in leading medical schools, have already proven themselves invaluable in the conduct of board activities.

In 1943, at the annual business meeting, the American Society of Clinical Pathologists made no nomination for the Board of Pathology in view of the fact that the Section on Pathology and Physiology of the American Medical Association held no meeting and made no nomination. In accordance with the by-laws Drs. Kracke and Foot continue on the board until nominations and elections are made.

In 1944, Dr. Kracke and Dr. Foord of the American Society of Clinical Pathologists had completed two terms and therefore, under the By-Laws, were not eligible for reelection. Dr. James B. McNaught, Professor of Pathology, University of Colorado, and Dr. F. William Sunderman, Associate Professor of Medical Research, University of Pennsylvania, were nominated by the American Society of Clinical Pathologists and elected by the board. In addition, the board elected a third member at large, Dr. R. Philip Custer of the Presbyterian Hospital, Philadelphia.

The annual meeting of the board in 1946 was a most important one. Four members of the Trustees who had served since the founding, Dr. Arthur H. Sanford, Dr. Frederick H. Lamb, Dr. F. W. Hartman, and Dr. J. J. Moore, had served two terms. With the election of their successors, the Board of Trustees was made up entirely of those who had not participated in the initial organization. The American Medical Association Section nominated Dr. James Kernohan of the Mayo Foundation and Dr. R. Philip Custer (a member-at-large), and the American Society of Clinical Pathologists nominated Dr. Edwin W. Schultz of Stanford University and Dr. Joseph A. Kasper of Detroit.

Officers of the board elected in 1946 were reelected in 1947 as follows:

Dr. N. C. Foot, President.
Dr. F. William Sunderman, Vice-President.
Dr. Robert A. Moore, Secretary-Treasurer.

PURPOSES OF THE BOARD

A. To encourage the study and promote the practice of pathology.

B. To elevate the standards and advance the cause of pathology by encouraging its study and improving its practice.

C. To determine the competence of those wishing to practice this specialty of pathology and to arrange, conduct and control investigations and examinations to determine the qualifications of such individuals who voluntarily apply for the certificates issued by the corporation.

D. To grant and issue certificates in the special field of pathology to voluntary applicants therefor and to maintain a registry of holders of such certificates.

E. To serve the public, the medical profession, hospitals and medical schools by preparing and furnishing lists of specialists who have been certified by the corporation.

VALUE OF THE CERTIFICATE

Judging from the experience of other specialties operating a certifying board it is anticipated that the certificate will be of value in that the medical profession, the lay public, and hospital administrators will utilize certificates from the board as a means of discriminating between those that are thoroughly qualified in pathology and those that are not. Lists of those holding certificates will be made available from time to time by this board through the publication of the same in pamphlets and in national medical journals.

BOARD NOT AN EDUCATIONAL INSTITUTION

The board is in no sense an educational institution and the certificates of the board are not to be considered degrees. Therefore the certificate does not confer on any person legal qualifications, privileges, or license to practice medicine or the specialty of pathology. The board does not purport in any way to interfere with or limit the professional activities of any licensed physician. Its chief aim, as stated above, is to standardize the qualification for the specialty of pathology and to issue certificates to those voluntarily complying with the requirements of the board.

GENERAL REQUIREMENTS

A. General qualifications:

1. Satisfactory moral and ethical standing in the profession.
2. License to practice medicine.
3. Membership or associate membership in the American Medical Association or by courtesy membership in such Canadian or other national medical societies as are approved by the Council on Medical Education and Hospitals of the American Medical Association.
4. That the applicant devotes his time primarily and principally to the practice of pathology.

B. Professional education.[1]

1. Graduation from a medical school in the United States or Canada, approved by the Council on Medical Education and Hospitals of the American Medical Association.

C. Special training, to be effective after July 1, 1938:

1. Completion of an internship of not less than one year in a hospital approved by the Council on Medical Education and Hospitals of the American Medical Association.
2. A period of study, exclusive of internship, of not less than three calendar years, exclusive of reasonable vacation periods, in an institution recognized by the same Council and the Board of Trustees as competent to provide a satisfactory training in the field of pathology. This period of special training preparation shall include the following:
   (a) Graduate training for one year in the various phases of clinical pathology.
   (b) Training and experience of not less than two years in a department of pathologic anatomy.
   (c) Such training may be combined or in sequence.
3. A fifth year of training or practice in pathology.

D. Special qualifications:

1. The board may accept candidates without special training as outlined in Section C above provided that:

(a) The candidate shall have been for a period of five years of professorial rank in a department of pathology in an approved medical school, before 1939; or the candidate shall have been practicing pathology for ten years before 1939 in a senior position in a hospital having an adequate department of pathology, and approved by the Council on Medical Education and Hospitals of the American Medical Association. Candidates with the qualifications outlined above may be certified without examination at the discretion of the board until Dec. 31, 1947.

(b) The candidate shall have been in the practice of pathology for ten years after internship. . . . For each year of training these candidates have received which met the qualifications outlined under "2" of Section C of General Requirements, two years of credit will be given toward the ten which they must ultimately have to become eligible for examination. Candidates with the qualifications outlined in this paragraph may become eligible for examination at the discretion of the board.

CREDIT FOR MILITARY SERVICE

Credit is allowed for training and experience in pathology as it may be acquired by the applicant during his military service. This credit for training or experience or both is given on an individual basis and will depend upon the opportunity the applicant has had as indicated by his medical service record in the specialty of pathology.

After July 1, 1947, no credit will be given to those in the regular corps of the military services or Public Health Service, except for training comparable to that outlined in Sections C and D of General Requirements. This rule does not apply to those serving in the Reserve Corps.

APPLICATION BLANK AND FEE

Application must be made on the special form which may be procured from the secretary and forwarded with other required credentials and the application fee. Applications cannot be given consideration by the board unless accompanied by the application fee.

The application or examination fee for candidates is $35.00. If certified without examination, $10.00 of fee will be refunded. If the candidate fails in his examination he will be admitted to a second examination after one year, but not later than three years, without additional fee. After two reexaminations the applicant must file a new application and pay an additional fee before a fourth examination will be given.

The examination fee of $35.00 has been arrived at after careful consideration, and is based on actual estimates of the expense of examination and administration. None of the board members receive any compensation for their services except actual expenses incurred.

If the applicant, for any reason, is deemed ineligible for examination by the board his fee will be returned; however, the application fee is not returnable after the candidate has officially been accepted for examination and notified to report for same.

EXAMINATIONS

Written and oral examinations will be held at or near the time and place of national medical meetings at the discretion of the board. If a number of applications from any region of the country are received an examination in conjunction with a national meeting in that section will be arranged so that the financial outlay of the applicant in meeting the examiners will be as small as possible.

The examinations are to be based on the broad principles of pathology with emphasis on diagnosis and interpretation. The applicant may apply for certification in either pathologic anatomy or clinical pathology, or both.

DEFINITIONS

1. Pathologic anatomy is that branch of pathology which deals with the morphologic aspects of disease, recognition being given that this definition covers two phases of pathology.
   (a) The applied phase, with special attention to biopsy description and diagnosis.
   (b) The academic phase of teaching and general morphological diagnosis.
2. Clinical pathology is that branch of pathology which deals with bacteriology, immunology, biochemistry, parasitology, hematology, and clinical microscopy, in relation to the diagnosis, prognosis, and treatment of clinical disease.

REEXAMINATIONS

In case the candidate fails in the qualifying examination he will be eligible for reexamination after one year has elapsed, but he must give written notice of his intention to appear for reexamination. Two reexaminations are allowed without an additional fee, provided they are taken within a three year period. The candidate who fails three times must file a new application and pay a second $35.00 fee before he is eligible for further examination.

REVOCATION OF CERTIFICATES

Certificates issued by the American Board of Pathology are subject to the provisions of the Articles of Incorporation, No. XI, Section 4. Any certificate issued by the Board of Trustees shall be issued subject to revocation in the event that:

A. The physician or party so certified shall have made any misstatement of misrepresentation of a material fact in this application, or in any other communication to the board or its representatives, which misstatement of misrepresentation affected the eligibility of the physician or the party so certified.

B. The issuance of such certificate has been made contrary to or in violation of any of the rules, laws or regulations of this corporation.

C. It is ascertained that the physician or party so certified is not eligible in fact to receive such certificate.

D. The physician or party receiving such certificate shall prior to the issuance of such certificate or thereafter have been convicted by a court of competent jurisdiction of a felony or of any misdemeanor in the opinion of the Board of Trustees, shall involve moral turpitude.

E. The physician or party receiving such certificate shall prior to or thereafter have his license to practice medicine revoked.

F. The physician or party receiving such certificate shall be expelled from any of the societies or organizations making him eligible to this corporation as an applicant for such certificate.

Address all communications to the Secretary-Treasurer.

AMERICAN BOARD OF PEDIATRICS

C. Anderson Aldrich, President, Rochester, Minn.
Donovan J. McCune, Vice President, New York.
Lee F. Hill, Secretary-Treasurer, 718 Royal Union Building, Des Moines, Iowa.
Hugh McCulloch, St. Louis.
Charles F. McKhann, Cleveland.
M. Hines Roberts, Atlanta, Ga.
Edward B. Shaw, San Francisco.
Harold C. Stuart, Boston.
Ashley A. Weech, Cincinnati.

ORIGIN

The American Board of Pediatrics was established in June 1933 by joint action of the American Pediatric Society, the American Academy of Pediatrics and the Section on Pediatrics hospital, or under a sponsorship accredited by the American Board of Plastic Surgery for such training. By the latter statement it is meant that one may secure the necessary and specified training as an assistant to an accredited surgeon, provided suitable facilities for the education of the candidate are offered.

---

[1] In case of an applicant whose education and/or training has been received outside the United States or Canada, his credentials must be acceptable to the National Board of Medical Examiners and the American Board of Pathology.

The period of special training should emphasize the relation of the basic sciences, anatomy, pathology, physiology, biochemistry and bacteriology, to the application of surgical principles which are fundamental in all branches of surgery.

In addition, the candidate before becoming eligible for consideration by any surgical specialty board must understand and be trained in the following subjects, viz.: the care of emergencies, shock, hemorrhage, blood replacement, electrolyte and fluid balance, protein and nitrogen balance, choice of anesthetics, chemotherapy, acidosis and alkalosis, narcotics and hypnotics, wound healing, etc.

TRAINING FACILITIES

Neither the board nor its individual members can be responsible for the placing of applicants for training, but it should be noted by the applicants that accredited work will be considered that which is done on a plastic surgery service approved by the board. A list of approved plastic surgical services is available in the secretary's office.

Because of the vagaries of training, such as changes from one specialty to another, interims of military duty and other service to the country, the aptitude and skill of candidates, the board may, at its discretion, review and make recommendations for or against certification of certain applicants outside of the listed qualifications and requirements.

The board reserves the privilege of requesting lists of operations done solely by the candidate for one or two years, or of requesting special and extra examinations, written, oral or practical, and of requesting any specific data concerning the candidate that may be deemed advisable before making final decisions for certification.

Furthermore, because of its endeavor to arrive at the most equable policy for all concerned, the board reserves the privilege of changing requirements and qualifications without necessarily issuing a new booklet of information.

CASE REPORTS

Candidates whose general eligibility and professional requirements are found satisfactory shall be required to submit twenty-five diversified case reports, together with photographs, to the secretary of the board. This group of case reports must include a variety of material from the entire body rather than a number of cases of one type, and should carry the candidate's personal deductions, conclusions and comments and should be sufficiently detailed to show if the conclusions drawn indicate a grasp of the subject and if the results justify the procedure.

Each case report should be typewritten on paper approximately 8½ x 11 inches, separately numbered and paged, with the candidate's name on each page. Each report should be individually assembled and held by removable fasteners and should have a cover sheet with the candidate's name, the number of the case, hospital number, diagnosis and a brief summary of the case (not over 100 lines). The case reports, photographs and other data are to be filed with the permanent records of the board. Cases should be chosen from the private practice of the candidate or from the hospital or clinic services; in the latter case, their identification numbers are required. The initials, color, age and occupation of each patient should be stated, as should the name of the hospital where treated and dates of admission, operation and discharge. The important details of family history, if relevant, and of the previous history should be given. The history of the condition for which the candidate was consulted should be stated clearly and concisely, indicating previous treatment, if any, and the mental, social or economic factors involved. The physical examination of the patient with special reference to the existing deformities should be carefully described. All laboratory and other special examinations, such as roentgenograms which were made, should be reported, with a statement of what was determined by them. The indications for operation and for the type of operation employed should be given. The preliminary treatment and the type of anesthesia used should be stated. A full description of the operative technic with methods of hemostasis, suture and drainage, if any, and the name of the assistant should be given. The early and late postoperative course and results should be described.

Photographs of conditions and drawings of operative technic, illustrative of each case, should be included and securely attached to each case report, with name of the candidate and the number of the case indicated. All photographs should be made by a sharp focus lens from untouched negatives with identical lighting conditions, exposure and developing, and should show conditions before and after operations with clear detail.

If the case reports and lists of operations are approved, the candidate will receive subsequent information regarding taking the examinations.

EXAMINATIONS

The qualifying examinations will be divided into Part I—Written, and Part II—Oral and Practical.

Part I shall consist of a written examination prepared by the Examination Committee on questions which concern the theory and practice of surgery. The examination shall also include questions on applied anatomy, applied physiology, pathology, bacteriology, clinical laboratory methods, local and general anesthesia, shock, hemorrhage, the handling of tissues, wound healing, and surgical accidents.

Or, when finally adopted by the combined surgical specialty boards, the single, written basic examination (Part I) in the fundamentals of surgery will be the requirement, and will be practically as follows: That after not less than three years of acceptable basic training in surgery a candidate may be given an examination in the fundamentals of surgery, required of all who enter any surgical field, covering the following subjects: current application to surgery of applied biochemistry, pathology, anatomy, physiology, bacteriology and pharmacology, including the principles governing fluid and electrolyte balance, shock, hemorrhage, death of tissue, blood coagulation, inflammation, infections, modern drug therapy, anesthesia, wound healing, thrombosis, embolism, respiration and oxygen requirements, tumor growth, and other related subjects.

Part II shall, as far as possible, be of a practical nature, and shall be conducted by no fewer than two competent examiners selected by the board.

The clinical examination shall include any or all of the following:

1. The exhibition of patients who have undergone or who are undergoing treatment by the candidate.
2. Examination, diagnosis, and presentation of a plan of correction by the candidate of cases provided by the examiners.
3. Oral examination of the candidate and observations made in the operating room, treatment rooms, and wards.
4. A written examination concerning plastic surgery may be given to correlate the clinical evaluation.

In order to be eligible for Part II of the examination, a candidate shall have successfully passed Part I of the board or the basic examination of the combined surgical boards or have been certified by the American Board of Surgery and have had two to four years extra accredited training in plastic surgery.

REEXAMINATIONS

Candidates may be reexamined provided that one year shall elapse between examinations, except in such case as the board may, for good and sufficient reason, deny a candidate the privilege of reexamination. Candidates shall be required to pay a fee of $50 for reexamination.

FEES

The fee for the examination and the certificate of the American Board of Plastic Surgery is $100. Of this sum, $25 must accompany the application. The remaining $75 should be paid when the candidate is notified of acceptance for examination. There shall be no refunds.

This fee may be increased at the discretion of the board.

This board is a non-profit organization. The fees of candidates are used solely for defraying the actual expenses of the board.

Because of the limited number of surgeons certified by this board it is necessary to request $10 annually from diplomates, after the first year, to defray expenses of the board.

CERTIFICATION

A certificate, bearing the seal of the board and the signatures of its officers will be issued to each successful candidate attesting his qualification in plastic surgery.

It is the board's prerogative to determine the fitness professionally and ethically of any candidate for its certificate.

The action or decision of the American Board of Plastic Surgery regarding the certification of any candidate shall be final.

REVOCATION OF CERTIFICATE

The American Board of Plastic Surgery shall have the sole power, jurisdiction, and right to determine and decide whether or not the evidence or information placed before it is sufficient to constitute grounds for revocation of any certificate issued by the board, and the decision of the board in the premises shall be final.

Address all communications to the secretary-treasurer.

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY

Walter Freeman, President, Washington, D. C.
A. R. Vonderahe, Vice President, Cincinnati.
Francis J. Braceland, Secretary-Treasurer, 102-110 Second Avenue, S. W., Rochester, Minn.
Spafford Ackerly, Louisville, Ky.
Kenneth Appel, Philadelphia.
Roland Mackay, Chicago.
H. Houston Merritt, New York.
Hans Reese, Madison, Wis.
George H. Stevenson, London, Ontario.
John C. Whitehorn, Baltimore.
Lawrence F. Wooley, Atlanta, Ga.
S. Bernard Wortis, New York.

HISTORY AND STATEMENT OF PRINCIPLES

The American Board of Psychiatry and Neurology was founded in 1934 following conferences of committees appointed by the American Psychiatric Association, the American Neurological Association, and the Section on Nervous and Mental Diseases of the American Medical Association. This action was taken in response to a widespread desire among specialists in psychiatry and neurology for some means of distinguishing the fully qualified specialist from the would-be specialist of inferior training and inadequate experience. That this desire is by no means limited to those who practice psychiatry and neurology is indicated by the formation of corresponding boards covering internal medicine, surgery, and the major specialties. The success of this method of distinguishing the specialists is indicated by the increasing number of candidates taking the examinations, and by the listings accorded in the American Medical Directory to those specialists holding certificates of the various boards.

CONSTITUTION AND ACTIVITIES

The American Board of Psychiatry and Neurology is composed of twelve members, four each from the American Neurological Association and from the American Psychiatric Association and two neurologists and two psychiatrists elected by the Section on Nervous and Mental Diseases of the American Medical Association. Annual elections to fill the places of members whose terms have expired take place in each of the nomination associations with the understanding that neurology and psychiatry are always equally represented on the board. The board holds annual meetings in December of each year for the transaction of whatever business may come before it and also holds special meetings for the purpose of examining candidates.

CHIEF FUNCTIONS

(a) To determine the competence of specialists in psychiatry and neurology.

(b) To arrange, control and conduct investigations and examinations to test the qualifications of voluntary candidates for certificates issued by the board.

(c) To grant and issue certificates or other recognition of special knowledge in the field of psychiatry and neurology to successful voluntary applicants therefor.

(d) To serve the public, physicians, hospitals and medical schools by preparing lists of practitioners who shall have been certified by the board.

(e) To consider and advise as to any course of study and technical training, and to diffuse any information calculated to promote and ensure the fitness of persons desirous of qualifying for a certificate of qualifications to be issued thereby.

POLICIES AND PROCEDURES REGARDING APPLICATION, TRAINING, EXAMINATION AND CERTIFICATION

In carrying out its specified functions, the American Board of Psychiatry and Neurology has formulated By-Laws to guide its activities and to indicate to applicants and other interested persons its policies regarding training requirements, examinations, fees, etc. These By-Laws have been amended from time to time. The statements given below embody the most recent amendments and represent the current policy of the board (1947). If, however, a candidate has evidence of equivalent qualifications, training and experience, but not in the pattern here formulated, this evidence with appropriate documentary support may be included in his application, for evaluation and possible approval by the board.

Application for Certificates.—An application, in order to be considered at any meeting of the board, must be in the hands of the secretary of the board *not less than 90 days before the date of such meeting.* A proper application form may be obtained from the secretary. Application may be made for certification in psychiatry or in neurology or in both fields. Applications will be formally considered only when made on the official application blank in such form as may be adopted from time to time by the board and when accompanied by an application fee in such amount as may be fixed by the board.

The secretary of the board on receipt of an application shall forthwith make inquiries from those to whom the candidate refers and from such other persons as the secretary may deem desirable and shall verify the candidate's record from the biographical records of the American Medical Association, after which he shall forward the application to the Committee on Credentials. This committee shall consider the application and other information available and notify the secretary whether the application is accepted. The certification of a candidate in either psychiatry or neurology, or both, shall be approved by a majority of the members of the entire board at any meeting held for such certification.

Form of Certificates.—There shall be separate certification in psychiatry and in neurology and two certifications or a combined certification for those qualified in both fields. The certifications shall be in such form as approved by the Board of Directors.

General Requirements for Applicants.—Each applicant for a certificate must establish that—

(a) He is a physician duly licensed by law to practice medicine.

(b) He is of high ethical and professional standing.

(c) He is now a member of the American Medical Association, or a member of such medical societies as are recognized for purposes of certification by the Council on Medical Education and Hospitals of the American Medical Association. Exceptions to the foregoing may be made at the discretion of the board for good and sufficient reasons.

(d) He has received adequate training in psychiatry or neurology, or both, as a specialty.

CLASSES OF APPLICANTS

Class A—Candidates graduated from medical school before the foundation of this board (1934) will not be held to the strict interpretation of the published requirements in formal graduate training. Under such circumstances the board will consider the training and experience of the applicant and decide whether or not he will be admitted to the examination.

Class B—Candidates graduated from a medical school after 1934 shall fulfil the following special requirements.

PROFESSIONAL EDUCATION

1. Graduation from a medical school in the United States or Canada approved by the Council on Medical Education and Hospitals of the American Medical Association. In case of an applicant whose training has been received outside the United States and Canada, his credentials must be satisfactory to the aforementioned Council and the Advisory Board for medical specialties.

2. Completion of a year's internship approved by the same Council in general medicine, general surgery, pediatrics or a rotating internship.

3. The nine month wartime internships, assistant residencies, or residencies will be accepted as an equivalent of one year.

SPECIAL TRAINING

(These requirements will be rigidly enforced after Jan. 1, 1948.)

Admission to the examination for certification in psychiatry or neurology requires a total experience of not less than five years.

There shall be a period of three years of full time study in institutions recognized by the Council on Medical Education and Hospitals of the American Medical Association, and approved by this board as competent to provide training in psychiatry or neurology. A candidate may submit to the board evidence of special training in psychiatry or neurology not covered in these specifications for its evaluation and approval.

In addition to three years of training under supervision, each candidate should have two years of clinical practice with major responsibility for the care of patients.

This training for psychiatrists should include clinical work with psychoneurotic and psychotic patients, combined with the study of the basic *psychiatric sciences, medical and social* psychology, psychopathology, psychotherapy, and physiological therapies, including a basic knowledge of the form, function and pertinent pathology of the nervous system. This training should be supervised and guided by teachers competent to develop skill and understanding in the utilization of such basic knowledge in dealing with patients. Mere factual knowledge is not sufficient. This training period should include instruction in the psychiatric aspects of general medical and surgical conditions and the behavior disorders of children and adolescents sufficient to develop practical ability to direct the treatment of such conditions. It should also include collaborative work with social workers, clinical psychologists, courts, and other social agencies. The training program of the candidate for certification in psychiatry should include sufficient training in neurology to recognize and to evaluate the evidences of organic neurological disease.

The training for neurologists should be based on clinical work with adults and children with neurological disorders, including the neurological complications of medical and surgical conditions. This shall be combined with study of the basic neurological sciences, neuroanatomy, neurophysiology, neuropathology, and neuroentgenology. This training should be supervised and guided by teachers competent to develop skill and understanding in the utilization of such basic knowledge in dealing with patients. Mere factual knowledge is not sufficient. This training should include sufficient psychiatry to enable the candidate to recognize and evaluate the common psychiatric reactions.

Candidates seeking certification in both neurology and psychiatry or supplementary certification in one after being certified in the other must submit evidence satisfactory to the board of additional two years of full-time basic training in the supplementary specialty.

Thus, no candidate is eligible for examination by the board until he has completed at least five years of special training and experience in neurology or psychiatry for a single certificate, or at least seven years of training and experience for certification in both neurology and psychiatry.

TRAINING IN THE ARMED FORCES

Credit will be granted for one year of wartime service in the Army, Navy, Public Health Service and Veterans Administration. Further credit for basic training will be granted only if the training has been received in an institution recognized by the Council on Medical Education of the American Medical Association and approved by this board. Time beyond one year spent in the above government agencies may be credited to experience, providing the candidate has been regularly assigned to a service in neurology or psychiatry.

EXAMINATIONS

Date and places of examinations are set by the board at its discretion and are announced in *The Journal of the American Medical Association*, in the *American Journal of Psychiatry*, in the *Journal of Nervous and Mental Diseases*, and in the *Archives of Neurology and Psychiatry*.

The examinations are designed to test the competence of the candidates. There will be separate examinations for certification in psychiatry and in neurology. The board requires some proficiency in neurology on the part of those it certifies in psychiatry and vice versa, but examines the candidate in accordance with the certificate he seeks. The examination will be of such type that no adequately trained individual will fail, yet they will be sufficiently searching so that the specialist in fact may be separated from the specialist in name. The practical examination will include the examination of patients under the supervision of the examiner. The manner of examining patients, and the reasoning and deductions therefrom, will constitute an important part of the examination. Oral and practical examinations will be given in the basic sciences with special regard to their clinical implications.

PAYMENT OF FEES

The candidate upon filing his application shall accompany it with an application fee of $25.00, which is not returnable. When notified by the secretary that he is eligible for examination, he shall send to the secretary an examination fee of $25.00 for examination in either psychiatry or neurology. There will be separate examinations for certification in psychiatry and in neurology. Should the applicant desire examination in both at one meeting of the board, he shall send an examination fee of $50.00. A candidate who has failed in one examination is eligible for reexamination within three years on payment of a reexamination fee of $25.00. A candidate who has been conditioned in one examination is eligible for reexamination within three years on payment of a reexamination fee of $10.00. A candidate who has been certified in either psychiatry or neurology, and who has been admitted to the supplementary examination for the other certificate, shall pay an additional examination fee of $25.00 The candidate who has failed twice, or one who does not apply for reexamination within three years, will be considered a new applicant.

PLEDGE

Each candidate is required to sign the following pledge:

"I hereby make application to the American Board of Psychiatry and Neurology, Incorporated, for the issuance to me of a certificate of qualification as a specialist in (a) Psychiatry; (b) Neurology; (c) Psychiatry and Neurology (check the one desired) and for examination relative thereto, all in accordance with and subject to its rules and regulations. On the issuance of the certificate I agree to and do become bound by the By-Laws of the American Board of Psychiatry and Neurology, Inc., so far as applicable.

"I agree to disqualification from examination or from the issuance of a Certificate of Qualification or to forfeiture and redelivery of such Certificate of Qualification in the event that any of the rules governing the examination are violated by me or for any one of the reasons set forth in the By-Laws. I agree to hold said American Board of Psychiatry and Neurology, Inc., its members, examiners, officers and agents, free from any damage or claim for damage or complaint by reason of any action they, or any of them, may take in connection with the application, such examination, the grade or grades given with respect to any examination, and/or the failure of said Corporation to issue to me such a Certificate of Qualification."

RULES AND REGULATIONS

The Board of Directors, from time to time, by resolution adopted by the affirmative vote of a majority then in office, may adopt, amend or repeal rules and regulations respecting requirements of applicants, the nature and extent of examinations and investigations and issuance of such certificates.

REVOCATION OF CERTIFICATES

All certificates issued for the Corporation shall be issued subject to the provisions of the Certificate of Incorporation and of the By-Laws of the American Board of Psychiatry and Neurology, Inc. Each such certificate shall be subject to revocation in the event that:

(a) The issuance of such certificate or its receipt by the physician shall have been contrary to or in violation of any of the provisions of the Corporation's Certificate of Incorporation or By-Laws; or

(b) The physician so certified shall not have been eligible in fact to receive such certificate, irrespective of whether or not the facts constituting him so ineligible were known to any or all of the directors of the corporation or could have been ascertained by any or all of the directors of the corporation at the time of the issuance of such certificate; or

(c) The physician so certified shall have made any deliberate misstatement of fact in his application for such certificate or in any other statement or representation to the corporation, its directors, representatives or agents, or

(d) The physician so certified shall have been convicted by a court of competent jurisdiction of a felony or of any misdemeanor involving, in the opinion of the Board of Directors of the corporation, moral turpitude in connection with his practice of medicine; or

(e) The physician so certified shall have had his license to practice medicine revoked or shall have been disciplined or censored as a physician by any court or other body having proper jurisdiction and authority.

AMERICAN BOARD OF RADIOLOGY

E. L. JENKINSON, President, Chicago.
I. H. LOCKWOOD, Vice President, Kansas City, Mo.
B. R. KIRKLIN, Secretary-Treasurer, Room 322, Mayo Clinic, Rochester, Minn.
RAY A. CARTER, Los Angeles.
D. S. CHILDS, Syracuse, N. Y.
L. H. GARLAND, San Francisco.
ROSS GOLDEN, New York.
H. DABNEY KERR, Iowa City.
L. C. KINNEY, San Diego, Calif.
F. W. O'BRIEN, Boston.
J. W. PIERSON, Baltimore.
U. V. PORTMANN, Cleveland.
DOUGLAS QUICK, New York.
LEO G. RIGLER, Minneapolis.
B. P. WIDMANN, Philadelphia.

HISTORY AND AUTHORITY FOR ORGANIZATION

The medical profession has long felt that there should be a standard of minimal requirements for the practice of any specialty in medicine in order to protect the public, the profession in general, and the specialists themselves. Some of the states have attempted by statute to prescribe such requirements in certain branches. Unless a better method of regulation were found, the other states would be likely to enact similar laws. The result would be forty-eight different standards for each of the many medical specialties. Obviously, a more practicable solution would be for each special group to put its own house in order and place its mark of approval on those qualified to practice as specialists in that particular field. Accordingly, in 1932, five nation-wide radiologic organizations, the Section on Radiology of the American Medical Association, the American Roentgen Ray Society, the Radiological Society of North America, the American College of Radiology, and the American Radium Society, each appointed a committee of three members to confer and investigate the feasibility of establishing a qualifying board. The following men were appointed by these five organizations: Drs. G. W. Holmes, J. W. Pierson, E. L. Jenkinson, W. E. Chamberlain, E. C. Ernst, W. F. Manges, L. R. Sante, L. C. Kinney, A. C. Christie, Albert Soiland, W. W. Wasson, Henry Schmitz, Lester Hollander, Rollin H. Stevens and B. R. Kirklin.

This combined committee met at Milwaukee in 1933, during the meeting of the American Medical Association, agreed unanimously that such a board should be established and so reported to the respective organizations. Each of the organizations approved the report, appointed three representatives, and empowered them to proceed to the formation of a national radiologic board. The members of the board thus chosen were: Drs. W. F. Manges, L. R. Sante and B. R. Kirklin, representing the American Roentgen Ray Society; Drs. A. C. Christie, E. C. Ernst and E. L. Jenkinson (succeeding Dr. Byron H. Jackson, originally appointed) representing the American College of Radiology; Drs. R. H. Stevens, Henry Schmitz and H. K. Pancoast, representing the American Radium Society; Drs. L. J. Menville, M. C. Sosman and Albert Soiland, representing the Radiological Society of North America, and Drs. L. C. Kinney, J. W. Pierson and G. W. Holmes, representing the Section on Radiology of the American Medical Association.

The board was incorporated, organized and held its first meeting in Washington, D. C., in May 1934. At that time the by-laws were adopted and provision was made by resolution for its proper function. The officers of the board elected at this meeting were:

Dr. H. K. Pancoast, President.
Dr. A. C. Christie, Vice President.
Dr. B. R. Kirklin, Secretary-Treasurer.

This move put into action the determined effort on the part of these five national organizations to improve the standards of the practice of radiology. It expects to accomplish this by various activities, such as the investigation and encouragement of facilities for graduate extension study and active clinical assistantships for men desiring to specialize in radiology. It will endeavor by regular examinations to determine the competence of specialists in radiology who apply for the certificate.

During 1934 the American Board of Radiology was accepted for membership in the Advisory Board for Medical Specialties and was also approved by the Council on Medical Education and Hospitals of the American Medical Association. The list of Diplomates of the board replaced Council's list of approved radiologists, and the latter list was discontinued.

PURPOSES

First: To encourage the study and promote and regulate the practice of radiology.

Second: To elevate the standards and advance the cause of radiology by encouraging its study and improving its practice.

Third: To determine the competence of specialists in radiology; to arrange, control and conduct investigations and examinations; and to test the qualifications of voluntary candidates for certificates to be issued by the board.

Fourth: To serve the public, physicians, hospitals and medical schools by preparing lists of practitioners who shall have been certified by the board.

VALUE OF CERTIFICATE

The national radiologic organizations which have participated in the formation of the board and are sponsoring its activities, as well as other organizations, attach considerable importance to its certificate. It is expected that both the medical and the lay public, including hospital directors, will soon come to utilize the certificate from this board as a means of discriminating between those who are well grounded as specialists in radiology and those who are not.

To this end lists of those holding certificates from this board will be published and issued from time to time by the board. Similar lists will be published by the *American Journal of Roentgenology and Radium Therapy*, *Radiology* and *The Journal of the American Medical Association*. The Directory of the American Medical Association will indicate by a numerical symbol in the biographic data of those whose names are eligible to appear on these lists that they are diplomates of this board.

For emphasis it is repeated that the board does not intend in any way to interfere with or limit the professional activities of any duly licensed physician, but it does aim toward standardized qualifications for those who claim to be specialists in radiology.

CERTIFICATES

A certificate will be issued to each candidate who meets the requirements of the board, to the effect that the holder of the certificate has had adequate training in radiology and has successfully fulfilled the requirements of the board.

A certificate granted by this board does not of itself confer, or purport to confer, any degree, or legal qualifications, privileges, or license to practice radiology. Certificates of the board shall be issued upon one of two forms:

1. A certificate to the effect that the applicant has been found qualified to practice radiology in all its branches.
2. A certificate to the effect that the applicant has been found qualified to practice radiology in one or more of the following special fields: (a) roentgenology; (b) diagnostic roentgenology; (c) therapeutic radiology.

DEFINITIONS

For the purposes of this board, the following definitions are adopted:

1. Radiology is that branch of medicine which deals with the diagnostic and therapeutic application of radiant energy including roentgen rays and radium.
2. Roentgenology is that branch of radiology which deals with diagnostic and therapeutic application of roentgen rays.
3. Diagnostic roentgenology is that branch of radiology which deals with the diagnostic application of roentgen rays.
4. Therapeutic radiology is that branch of radiology which deals with the therapeutic application of roentgen rays and radium.

GENERAL QUALIFICATIONS

Each applicant for admission to the examination shall be required to present evidence that he has met the following standards:

GENERAL REQUIREMENTS

1. Satisfactory moral and ethical standing in the profession.
2. A license to practice medicine in the state or county in which he resides.
3. Membership in the American Medical Association, or membership in such Canadian or other medical societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the American Medical Association. Except as herein provided, membership in other societies shall not be required.
4. That the applicant holds himself out to be a specialist in radiology or one of its branches as defined under "Definitions," and that he devotes his time primarily and principally (at least 75 per cent) to the practice of radiology or one of its branches.
5. That he is a citizen of the United States or Canada. Candidates from other countries must be permanent residents of that country and native citizens thereof.

GENERAL PROFESSIONAL EDUCATION

1. Graduation from a medical school recognized by the Council on Medical Education and Hospitals of the American Medical Association. If the applicant is a resident of the United States or one of its possessions and is a graduate of a medical school outside the United States or Canada, he must have a certificate of The National Board of Medical Examiners.
2. Completion of an internship of not less than one year in a hospital approved by the same Council.

SPECIAL TRAINING

(Applicable to candidates who begin their training on or after January 1, 1942, and to all candidates examined after January 1, 1945.)

1. After completion of the internship there shall be a period of special training in radiology of not less than three years in clinics, hospitals or dispensaries recognized and approved by The American Board of Radiology and the Council on Medical Education and Hospitals of the American Medical Association as

competent to provide a satisfactory training in radiology. This period of specialized training shall include:

(a) Graduate training in pathology, radiation physics and radiobiology.

A period of six months full-time training in pathologic anatomy is recommended but where this is not possible to arrange the student, during his three-year training period may, by attending pathologic conferences, postmortem examinations and studying removed tissues, receive adequate training in pathology. It is recommended that radiation physics be taught by a combination of didactic lectures, practical examples, and direct clinical demonstrations.

(b) An active experience (residency) of not less than twenty-four months in an institution, the radiologic department of which is recognized and approved by The American Board of Radiology and the Council on Medical Education and Hospitals of the American Medical Association as capable of providing satisfactory training.

(c) Examination in the basic sciences of radiology as well as the clinical aspects thereof.

These examinations should be given by the student's instructors in order to allow those responsible for his training to certify to the board that he is adequately prepared.

In the current emergency the board will allow one year of military service spent in a radiology department in the United States Army, Navy or Marine Corps to be applied toward the satisfaction of one year of graduate training.

APPLICATIONS

The board desires to appraise the candidate's educational opportunities (premedical, medical and radiologic), the ability of his instructors, his hospital and teaching positions, his original investigations, his contributions to radiologc literature, his membership in medical societies, and his local and general reputaton.

For this purpose, application must be made on a special blank which may be obtained from the secretary. No application will be considered unless made on the regular application blank. This application shall be forwarded with the required data, two unmounted photographs, and the fee of $50, at least two months before the date of the examination.

FEE

A fee of $50 must accompany each application blank. This fee will not be returned and no application will be considered until the fee is received. This fee has been carefully computed nd is used entirely for administrative purposes. Members of e board and special examiners do not receive any compensa- n except for actual expenses connected with holding the examinations. As the number of candidates decreases, it may become necessary to raise the fee.

Checks should be made payable to the American Board of Radiology.

EXAMINATIONS

Each year the board will hold an examination in conjunction with the annual meeting of the American Medical Association, and, when sufficient applications are on file, a second examination will be held in conjunction with the annual meeting of the American Roentgen Ray Society and/or the Radiological Society of North America.

For the present, examinations consist of practical and oral examinations, although written examinations may be added later. The examinations are designed to test the candidate's fitness to practice radiology or one of its branches as a specialty. The board will endeavor to adapt this examination to the candidate's experience and years of practice. It will try especially to ascertain the breadth of his clinical experience, his knowledge of the basic sciences of radiology, and likewise his knowledge of the recent literature on radiology, and his general qualifications as a specialist in this branch of medicine.

The examination consists of tests in film interpretation and an oral examination in pathology, physiology, radiophysics and radiobiology, as well as the clinical applications of roentgen rays and radium. The applicant is also examined in "professional adaptability," in an attempt to ascertain his attitude toward his fellow practitioners and his patients.

Whenever an applicant fails to pass the examination, the board, if requested, will make suggestions as to suitable courses of instruction for the purpose of overcoming his deficiencies.

REEXAMINATIONS

If the candidate fails in the first examination he will be admitted to a second examination after one year has elapsed but not more than three years. He must give sixty days' notice of his intention to appear for reexamination, and pay an additional fee of $25. If a candidate who has failed does not appear for reexamination before the expiration of three years, he will be required to make a new application and pay an additional fee of $50.

A candidate having failed twice may, after one year has elapsed, file a new application which must be accompanied by the fee of $50.

FINAL ACTION OF THE BOARD

The final action of the board is based on the applicant's professional record, training, and attainments in the field of radiology, as well as on the results of his examination. Any radiologist who is practicing radiology honorably and efficiently should have no difficulty in obtaining a certificate. This board has been organized, not to prevent qualified radiologists from obtaining certificates, but to assist them in becoming recognized in their communities as men competent to practice in the special field of radiology.

REVOCATION OF CERTIFICATES

Certificates issued by this board are subject to the provisions of the Articles of Incorporation and the By-Laws. According to Article IX, Section 4, of the By-Laws "Any certificate issued by the Board of Trustees shall be subject to revocation in the event that:

(a) The issuance of such certificate or its receipt by the physician so certified shall have been contrary to or in violation of any provision of the Certificate of Incorporation of this the American Board of Radiology or of these By-Laws; or

(b) The physician or party so certified shall not have been eligible in fact to receive such certificate; or

(c) The physician or party so certified shall have made any misstatement of fact in his application or in any other communication to the board or its representatives; or

(d) The physician or party so certified shall have been convicted by a court of competent jurisdiction of a felony or of any misdemeanor involving, in the opinion of the Board of Trustees, moral turpitude; or

(e) If the physician or party so certified shall have had his license to practice medicine revoked or shall have been expelled from one of the societies or organizations which is represented by this corporation through eligibility of such society or organization to nominate and appoint members of this corporation."

All official correspondence should be addressed to the secretary.

AMERICAN BOARD OF SURGERY

Fordyce B. St. John, Chairman, New York.
Samuel C. Harvey, Vice Chairman, New Haven.
J. Stewart Rodman, Secretary-Treasurer, 225 S. Fifteenth Street, Philadelphia 2.
William DeW. Andrus, New York.
Isaac A. Bigger, Richmond, Va.
Edward D. Churchill, Boston.
Warren H. Cole, Chicago.
Warfield M. Firor, Baltimore.
Howard K. Gray, Rochester, Minn.
Robert M. Moore, Galveston, Texas.
Frederick L. Reichert, San Francisco.
Calvin M. Smyth Jr., Philadelphia.
Nathan Womack, St. Louis.

(The American Board of Surgery is preparing a new and revised edition of its Booklet of Information which will be available for distribution by the board after Sept. 1, 1947. The revision was not available for publication in this issue of The Journal. The American Board of Surgery, however, submitted the following statement for inclusion in this number.)

Candidates who have the following requirements will be eligible for consideration by the American Board of Surgery:

Group I: Four years of education in surgery in a graded residency in one or more institutions. (A graded residency includes a period of training in which the trainee has increasing responsibility for the care of patients with surgical conditions.) The training programs of hospitals must be approved by an appropriate committee of the board, in addition to the approval of the hospital for graduate training by the Council on Medical Education and Hospitals of the American Medical Association or the American College of Surgeons. One year of the four may be in a subspecialty of surgery, such as proctology, thoracic surgery, plastic surgery, cancer surgery, orthopedics, gynecology, or experimental surgery. If the second year of a two year internship is surgical and in a hospital approved for graduate training, it will be acceptable on the above four years.

Group II: In lieu of the requirements for Group I, the board will continue to accept, for the present, three years of acceptable residency training, followed by two years of study or practice of surgery. The latter two years may be taken under one certified by the board and acceptable for this purpose to the board and carrying on his practice in hospitals fully approved as meeting the minimum hospital requirements of the American College of Surgeons.

In addition to the above groups, those candidates whose applications are now on file in the board's office and candidates with whom the board has had correspondence and whose training programs to this date have met the board's requirements, will be given consideration. After this date, no candidates will be accepted who do not meet the requirements as published in Groups I or II.

The new Booklet of Information of the American Board of Surgery will be ready for mailing about September 1. Requests for a copy of the booklet should be mailed to the board's office.

AMERICAN BOARD OF UROLOGY

GILBERT J. THOMAS, President, Minneapolis.
CLARENCE G. BANDLER, Vice-President, New York.
HARRY CULVER, Secretary-Treasurer, 210 Loring Medical Building, 1409 Willow St., Minneapolis 4.
GEORGE GILBERT SMITH, Brookline, Mass.
GEORGE F. CAHILL, New York.
E. GRANVILLE CRABTREE, Boston.
CHARLES C. HIGGINS, Cleveland.
A. I. DODSON, Richmond, Va.
GRAYSON CARROLL, St. Louis.

ORGANIZATION

The American Board of Urology was organized at Chicago, Ill., Sept. 24, 1934. The committee members present from the American Association of Genito-Urinary Surgeons were: Dr. William F. Braasch, Dr. Henry G. Bugbee, and Dr. Gilbert J. Thomas; those from the American Urological Association were Dr. Herman L. Kretschmer, Dr. Nathaniel P. Rathbun, and Dr. George Gilbert Smith; those from the Section on Urology of the American Medical Association were: Dr. Clarence G. Bandler, Dr. A. I. Falsom, and Dr. T. Leon Howard.

The officers of the board elected at this meeting were: Dr. Herman L. Kretschmer, President; Dr. Clarence G. Bandler, Vice-President; Dr. Gilbert J. Thomas, Secretary-Treasurer.

The board was incorporated May 6, 1935, and held its first legal meeting May 10, 1935.

PURPOSES

The first objective of the American Board of Urology, Inc., is to render better service to the public by insuring the competency of any physician or surgeon who is specializing, or who wishes to specialize, in the field of urology. The board will elevate the standards and advance the cause of urology. It will investigate the curricula of medical schools and will encourage adequate facilities for graduate instruction in urology.

FUNCTIONS

1. The board will arrange and conduct examinations testing the qualifications of volunteer candidates.
2. The board will grant and issue to physicians duly licensed by law, certificates or other equivalent recognition of special knowledge in urology; and revoke the same.
3. The board will endeavor to serve the public, hospitals, medical schools, medical societies and practitioners of medicine and surgery by preparing lists of urologists whom it has certified.

LIMITATIONS OF FUNCTIONS

The conferring of degrees, "Doctor of Medicine" or "Bachelor of Medicine" remains with the universities, where it belongs, and this board makes no attempt to control the practice of urology by license or legal regulations. This board does not intend in any way to interfere with or limit the professional activities of any duly licensed physician.

REASON FOR APPLYING FOR A CERTIFICATE; ITS VALUE

The American Urological Association, the American Association of Genito-Urinary Surgeons, and the Section on Urology of the American Medical Association are interested in furthering the cause of urology and have participated in the formation of this board. They are sponsoring its activities. The various national medical societies, the public, hospital directors and others will utilize the certification from this board as a means of discriminating between those well grounded as specialists in urology and those who are not.

Lists of individuals who have certificates from this board, and who are engaged in the practice of urology, are published in the Directory of the American Medical Association (signified in biographical data by symbol, "A.B.6"); in a handbook issued from time to time by the American Board of Urology, Inc., and in the Directory of Medical Specialists, published by the Advisory Board for Medical Specialties.

Application for this certificate is purely voluntary. There is only one type of certificate. No special marking or printing appears on the certificate which may identify diplomates who have or have not taken all or part of the examination. *All certificates are identical.*

The Advisory Board for Medical Specialties working in conjunction with, and reporting to, the Council on Medical Education and Hospitals of the American Medical Association, has set certain standards of preparation for specialization which the American Board of Urology, Inc., wishes to adopt. The Advisory Board has drawn from the experience of all the present functioning boards and has been of inestimable assistance in the formulation of the Constitution and By-Laws for the Board of Urology.

APPLICATION BLANK; REQUIREMENTS FOR ALL APPLICANTS

Application for certification must be made on a special form. This will be provided by the secretary and must be returned to him, accompanied by other required data and credentials and by $35 of the examination fee.

REQUIREMENTS FOR APPLICANTS

Each applicant, before he shall become eligible to take the examination for certification in urology, must:

A. Have graduated from a medical school of the United States or Canada recognized by the Council on Medical Education and Hospitals of the American Medical Association, and must have completed an internship of not less than one year in a hospital approved by the same council. (The former requirement is not applicable to a candidate who graduated from an institution now extinct, or whose graduation occurred before the American Medical Association had prepared a list of accredited medical schools.) All graduates of foreign medical schools must obtain a license in the state in which they propose to practice medicine and the certificate of the National Board of Medical Examiners before making application for certification.

B. Establish in a manner satisfactory to this board that he is a physician duly licensed by law to practice medicine, that he is of high ethical and professional standing and that he has received adequate special training in urology.

The board is attempting to increase and to standardize the facilities for urological training in teaching institutions, so that the expression "special training in Urology" may be interpreted to include:

1. A period of study, after the internship, of not less than three years in clinics, dispensaries, hospitals or laboratories recognized by the Council on Medical Education and Hospitals of the American Medical Association as competent to provide a satisfactory training in the special field of urology.

This period of specialized preparation should include:

(*a*) graduate training in anatomy, physiology, pathology, and the other basic medical sciences which are necessary to the proper understanding of the disorders and treatment involved in the specialty of Urology.

(*b*) an active experience of not less than eighteen months in hospital clinics, dispensaries and diagnostic laboratories recognized by the Council on Medical Education and Hospitals of the American Medical Association as competent in the diagnosis and treatment of urologic conditions.

(*c*) examinations in the medical sciences basic to the specialty of Urology, as well as in the clinical, laboratory and public health aspects.

2. An additional period of not less than two years in the practice of urology in the city from which he makes application.

These special requirements conform with the suggestions made by the Council on Medical Education and Hospitals of the American Medical Association.

C. Make application to the American Board of Urology, Inc., whose duty it shall be to investigate the applicant's credentials and make a survey of his character;

D. Assure the board that he is engaged in the practice of urology and that he intends to continue to be so engaged;

E. Membership in the American Medical Association, or comparable national medical association is recommended.

FEE

The examination fee is $100. (This fee will be increased when the expense of the examinations and other activities of the board demand.) Thirty-five dollars must accompany the application. If, on investigation, an applicant is found lacking in any of the requirements stated above, he will be notified that he is ineligible for examination. Sixty-five dollars must be paid when the applicant is accepted as a candidate for certification. Neither fee shall be returnable in any event.

If a candidate fails, he will be permitted a second examination after one year or within three years, without additional fee, but he must give sixty days' notice of his intention to appear for reexamination. After an applicant has failed twice, he must file a new application and pay a second fee.

REQUIREMENTS FOR CERTIFICATION

According to the By-Laws of the American Board of Urology, Inc., applications received from applicants for certification shall be examined by the Credentials Committee and reviewed by the board. When additional data are required to complete the application, these will be requested by the secretary.

The requirements for certification include: personal appearance before the board; preparation of reports of fifty major urological cases, under the candidate's own supervision, which must contain all items essential for diagnosis, therapy, prognosis, results of treatment, etc.; oral-clinical examinations, and written examinations.

In specific instances the board may waive any part of these requirements, with the exception of the item of personal appearance.

Each candidate will receive a notice of the time and place of the examinations and an appointment for his personal appearance before the board.

EXAMINATIONS, WHERE HELD, CHARACTER OF, AND REPORTS OF CASE HISTORIES

The board will hold one examination per year. This may be held in association with the annual meetings of the American Urological Association or the American Medical Association, when this is practicable, or at other times and places that the board may select or deem expedient.

The written examinations are designed to test the candidate's preparation in, and his knowledge of, the whole field of urology, including the fundamental subjects: pathology, anatomy, physiology, embryology, bacteriology, physiological chemistry and endocrinology. These may be given at the time of the oral-clinical examination or may be held on certain dates simultaneously in different parts of the country at places convenient for candidates. The examination in pathology will consist of the identification of gross specimens and of sections of tissue served through the microscope. The examination in anatomy, ology, embryology, bacteriology, physiological chemistry endocrinology will be a test of the candidate's working knowledge of these subjects as they are related to the practice of urology.

The oral-clinical examination will consist of discussions of common urological conditions. The subjects forming the basis of this examination are: urography; diseases of the genital organs, including the prostate; diseases of the urinary bladder, and diseases of the ureters and kidneys. The examination may deal directly with data found in the reports of case histories that the candidates have submitted. It will ascertain the candidate's familiarity with recent literature, the breadth of his clinical experience, and his general qualifications for practice in he specialty of urology.

The professional adaptability of each candidate will be investigated in an attempt to determine his ethical conduct and his attitude toward his patients and fellow practitioners.

The reports of fifty major urological cases must be consecutive and must have been under the candidate's own supervision. They must not be abstracted. Sufficient data should appear in these so the examiner will know that a proper history was taken and that a thorough examination, including a complete physical survey, was made.

Case reports that are copied verbatim from a hospital record are not accepted. They must be identified by the name of the hospital and the case admission numbers, with the pertinent dates. The reports must be typewritten on 8½ by 11 paper and in duplicate, but need not be on any special forms.

The data should be placed under proper headings and the arrangement of these should conform to the sequence of events incidental to the patient's admission to the hospital or clinic, the examinations made and the treatment prescribed.

The board requires that all of the essential points of the history and examination, as well as a complete description of the surgical procedure shall be given. Emphasis should be placed on the following items: Preoperative diagnosis, clinical and pathological diagnosis, laboratory data, including cultures of urine and chemical analysis of calculi; summary of postoperative course with special reference to morbidity, clinical findings at time of discharge from the hospital and subsequent "follow-up" reports.

A final short paragraph must be prepared for each case. This must include the candidate's interpretation of the history in terms of pathology; the basis for the diagnosis; the facts that determined the treatment prescribed, whether surgical or otherwise; the course of treatment to be pursued following discharge from the hospital or clinic; a critical discussion of the knowledge gained from the proper handling of the case, or from the errors made (if any) in the diagnosis and method of treatment.

Complete separate index lists must accompany the reports. If the reports are obtained from more than one hospital they must be consecutive and a separate index list of each group should be provided. These lists must state the operator's name at the head of each page, the name of the patient, the hospital and admission number, and the dates of operation. Statements from the superintendents of the hospitals, attesting that the candidate was the operator must be included. The lists will be filed in the secretary's office for verification purposes.

Each candidate must assume personal responsibility for the data in his case reports, including autopsy findings and interpretation of urograms.

A candidate must remember that these case reports are documentary evidence of his ability and that the material in them and the manner of presentation are important evidences of his competence as an urologist.

Satisfactory case reports must be submitted before a candidate will be permitted to continue with other parts of his examination. If case reports are pronounced unsatisfactory by more than one examiner, the candidate will be informed of this and requested to prepare others.

Case reports must be submitted to the secretary of the board at least ninety days before the time set for the oral-clinical examination.

FINAL ACTION OF THE BOARD

Final action is based on the applicant's training, his professional record, his attainments in the field of urology, and the results of the examination. Any well trained urologist will have no difficulty in obtaining the board's certification. This board is organized not to prevent qualified urologists from obtaining certificates, but to assist them in becoming recognized in their communities as men competent to practice in the special field of urology.

The activities described above proceed from the certificate of incorporation in which is stated the nature of the business, objects, and purposes proposed to be transacted and carried out by this corporation.

REVOCATION OF CERTIFICATE

Certificates issued by this board are subject to the provisions of the Articles of Incorporation and the By-Laws. According to Article IX, Section 4, of the By-Laws, "each certificate shall be subject to revocation in the event that:

"(*a*) The issuance of such certificate or its receipt by the physician so certified shall have been contrary to, or in violation of, any provision of the Certificate of Incorporation of this, the American Board of Urology, Inc., or of the By-Laws; or

"(*b*) The physician or party certified shall not have been eligible to receive such certificate, irrespective of whether or not the facts constituting him so ineligible were known to, or could have been ascertained by, the directors of the board at the time of the issuance of such certificate; or

"(*c*) The physician or party so certified shall have made any misstatement of fact in his application for such certificate or in any other statement or representation to the board or its representatives; or

"(*d*) The physician so certified, at any time while continuing to practice, shall cease to practice urology; or

"(*e*) The physician so certified shall at any time have neglected to maintain the degree of competency in the practice of the specialty of urology as set up by the board, and shall refuse to submit to reexamination by the board.

"The Board of Trustees of this Corporation shall have the sole power, jurisdiction and right to determine and decide whether or not the evidence or information before it is sufficient to constitute one of the grounds for revocation of any certificate issued by this corporation. The Board of Trustees may, however, in its discretion, require any physician so certified to appear before the Board of Trustees or before any one or more of them or before any individual or individuals designated by the Board of Trustees, on not less than twenty days' written notice, and to show cause, at the time and place specified in such notice, why his certificate should not be revoked on any one or more of the above-described grounds specified in such notice. The failure of any physician so notified to appear as required in such notice, without due excuse deemed sufficient to the Board of Trustees, shall constitute, ipso facto, cause for revocation of his certificate. The decisions of the Board of Trustees relating to all matters under this Section 4 shall be final and binding."

Checks should be made payable to: "The American Board of Urology, Inc."

Communications should be addressed to the secretary-treasurer.

ADVISORY BOARD FOR MEDICAL SPECIALTIES

Robin C. Buerki, President, Philadelphia.

FOREWORD

The Advisory Board for Medical Specialties has prepared this booklet for the purpose of furnishing general information regarding its activities in connection with graduate medical education and the certification of medical specialists in the United States and Canada. It is designed also to give detailed information concerning the procedure to be followed by examining boards in the various specialties in order to obtain membership in this Advisory Board and official recognition by the Council on Medical Education and Hospitals of the American Medical Association. This information is based in large part on the experience of previously formed boards during the past twenty-five years.

ORGANIZATION

This Advisory Board was organized in 1933-1934 to coordinate graduate education and certification of medical specialties in the United States and Canada.

Several specialty boards had been functioning actively and successfully for a number of years prior to the organization of the Advisory Board for Medical Specialties. Their purposes were, primarily, to establish minimum standards of graduate educational and training requirements for physicians representing themselves to the public as being specialists, with certification by the boards of candidates after they had been able successfully to pass the boards' examinations. Secondarily, these boards hoped to improve the general standards of graduate medical education and facilities for special training. This aim is being steadily and rapidly accomplished.

Credit for the improvement in undergraduate medical education, so noticeable in this country during the past thirty years, is due to the efforts of universities, educational foundations, medical schools, medical societies, and to public support along these lines. The same is true of the present transition in graduate education in the specialties, sharply stimulated by the establishment and activities of these certifying boards.

The American Board of Ophthalmology was the first special certifying board to be created in 1916; the American Board of Otolaryngology, established in 1924, was followed by the American Board of Obstetrics and Gynecology in 1930, and the American Board of Dermatology and Syphilology in 1932.

During part of this period of time plans for the organization of similar boards in other specialties were being actively projected, all of these groups being desirous of availing themselves of the experiences of the already existing boards.

It was soon recognized that some formal and official plan of organization must be established. It was clearly essential that an examining board must have the official sanction of the national societies in its given specialty as well as that of its section of the American Medical Association, but there was, at that time, nothing to prevent unofficial groups from organizing examining boards and using the title American Board.

Consequently, in order to avoid duplication of effort as well as to coordinate the work of the several boards and other interested groups into a concise and homogeneous plan for betterment, it was deemed advisable to create an Advisory Board which should give consideration to those problems common to all, and which should be representative of each organization concerned.

During the years 1933 and 1934 this Advisory Board was organized and began actively to function. Simultaneously at the Milwaukee session of the American Medical Association in 1933 a resolution was adopted authorizing the Council on Medical Education and Hospitals: (1) to formulate standards of administration based in general on those of the American Boards of Ophthalmology, of Otolaryngology, of Obstetrics and Gynecology, and of Dermatology and Syphilology and, (2) to recognize officially new boards meeting these standards, this recognition to be based upon previous approval and recommendation to the Council by the Advisory Board.

A constitution and by-laws for the Advisory Board was adopted at a meeting in Chicago on February 11, 1934. The original member organizations of the Advisory Board for Medical Specialties were: the Association of American Medical Colleges; the American Hospital Association; the Federation of State Medical Boards of the U. S. A.; the National Board of Medical Examiners; the American Board of Ophthalmology, founded 1916; the American Board of Otolaryngology, founded 1924; the American Board of Obstetrics and Gynecology, founded 1930; and the American Board of Dermatology and Syphilology, founded 1932. Two representatives were appointed from each of these organizations to serve on the Advisory Board. Since that time the American Board of Pediatrics (1934), of Psychiatry and Neurology (1934), of Radiology (1934), of Orthopaedic Surgery (1935), of Urology (1935), of Internal Medicine (1936), of Pathology (1936), of Surgery (1937), of Anesthesi-

ology (1938), of Plastic Surgery (1938), and of Neurological Surgery (1940) have been properly organized, approved, and elected to membership in the Advisory Board and recommended to the Council on Medical Education and Hospitals of the American Medical Association for official recognition. There are, therefore, fifteen examining boards now organized, approved and actively functioning in the fifteen specialties recognized as suitable fields for the certification of specialists.

The work of this board has been aided by grants from the Josiah Macy Jr., Foundation of New York, but the board is now supported by its component groups.

PURPOSE

Article II of the Constitution states that, "This board shall act in an advisory capacity to such organization as may seek its advice concerning the coordination of the education and certification of medical specialists." Specifically, this represents an official effort to advance the standards and improve the methods of graduate education and training in the medical specialties, with certification of men thus educated and trained who qualify as specialists in the various branches. The common interest of the member organizations in these purposes is obvious. It is equally apparent that some fixed definition of specialties needed to be established, preferably on a graduate educational basis, that minimum standards of organization and conduct for new examining boards should be fixed, and that some official method of recognition be developed.

There is no desire on the part of these boards to interfere with any practitioners of medicine in any of their regular or legitimate activities. Their fundamental purpose is to ensure to the public, both lay and medical, and for its protection, that physicians claiming to be specialists with presumably special proficiency in one or another branch of medicine actually possess the qualifications they claim. This presupposes special training and demonstrable capability along certain lines of work. Suitable evidence of this is the ability of an individual to satisfy an examining board about his training and then to pass the examination for certification.

Surveys of existing facilities for graduate training in the various specialties are being conducted at the present time; residencies as well as preceptorship and assistantship training are being studied; preparations for stimulating medical school and hospital facilities for the required graduate training are going forward actively; round table conferences furnish discussions of subjects of interest in regard to graduate medical education.

The Council on Medical Education and Hospitals of the American Medical Association has agreed, under the authority vested in it by the resolution passed at the Milwaukee meeting (1933) and referred to above, that applications of special examining boards for official approval are to be referred to the Council through the Advisory Board for Medical Specialties, recommendation by the Advisory Board for such approval to be based upon the standards mutually adopted. The understanding exists that the Council cannot be bound by recommendations of the Advisory Board but will consult the Advisory Board of Medical Specialties before acting on any application so long as mutually adopted standards are in force.

Early in 1940 there was published the first edition of the Directory of Medical Specialists containing the names and biographic data of all men certified by the several specialty boards, as well as information regarding the organization and *functions of these boards. The third edition (1946)* carries the names and medical biographies of 24,028 diplomates of the fifteen specialty boards.

In response to the generally recognized need for a clear formulation of the educational problems and principles involved in graduate and postgraduate medical training, the Advisory Board at its meeting in June 1937 voted to create a Commission on Graduate Medical Education to study the various aspects of the whole problem. This commission included representatives of the profession, the specialties, the universities, the hospitals, and the licensing bodies. The report of this commission comprising 304 pages appeared in 1940, published by the University of Chicago Press, and is of real assistance to the various specialty boards, hospitals, medical schools, and regulatory bodies dealing with this phase of American medicine.

MEMBERSHIP

The Advisory Board is composed of two representatives from each of the approved examining boards in the medical specialties and such other national organizations as are interested in education, examination, and certification of medical specialists and duly elected to this body.

The Constitution provides that, "To be eligible for representation in this board an examining board in a specialty must be composed of members elected from or appointed by societies recognized by this board as a national society in that specialty together with representation from the related section of the American Medical Association." On being accepted by the Advisory Board, the board in question is recommended to the Council on Medical Education and Hospitals of the American Medical Association as qualified for recognition. Membership in the Advisory Board provides for the inclusion of the name of the organization in all lists and directories published by the Advisory Board for Medical Specialties and provides *also for publication of the names of specialists certified* by each individual examining board.

This board reports directly to its member groups, and functions in close cooperation with the Council on Medical Education and Hospitals of the American Medical Association, and with the Advisory Council on Medical Education.

Meetings of the Advisory Board for Medical Specialties are held annually as required.

Traveling and other expenses of representatives in attendance are borne by member organizations.

SUGGESTIONS TO NEW BOARDS SEEKING APPROVAL

I. *ORANIZATION*

1. A special examining board to be approved by the Advisory Board for Medical Specialties should represent a recognized and distinct specialty of medicine. (It is agreed between the Council and the Advisory Board that no board shall be organized in a special field having less than one hundred members engaged in special practice in the United States.)

2. It should be composed of representatives of the national organizations in that specialty including the related section of the American Medical Association.

3. It should be incorporated.

4. A special board should:

(a) Determine whether candidates have received adequate preparation.

(b) Provide a comprehensive test of the ability and fitness of such candidates.

(c) Certify to the competence of those physicians who have satisfied its requirements.

II. DEFINITION OF SPECIAL FIELDS

The following branches of medicine at present are recognized as suitable fields for the certification of specialists.

1. Internal Medicine
2. Surgery
3. Pediatrics
4. Obstetrics and Gynecology
5. Ophthalmology
6. Otolaryngology
7. Dermatology and Syphilology
8. Psychiatry and Neurology
9. Urology
10. Orthopaedic Surgery
11. Radiology
12. Pathology
13. Neurological Surgery
14. Anesthesiology
15. Plastic Surgery

III. QUALIFICATIONS OF CANDIDATES

Each applicant for admission to the examination should be required to present evidence that he has met the following standards:

A. General Qualifications.

1. Satisfactory moral and ethical standing in the profession.

2. Membership in the American Medical Association or membership in such Canadian or other medical societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the American Medical Association. Membership in other societies should not be required. (Exceptions to the foregoing may now be made at the discretion of any individual board for good and sufficient reasons.)

B. Professional Qualifications.

1. Graduation from a medical school recognized by the Council on Medical Education and Hospitals of the American Medical Association.

2. Completion of an internship, preferably of the general rotating type, of not less than one year in a hospital approved by the same Council.

C. Special Training.

1. A period of study, after the internship, of not less than three years in clinics, dispensaries, hospitals or laboratories recognized by the same Council and respective specialty board as competent to provide a satisfactory training in the special field of study.

2 This period of specialized preparation should include:

(a) Graduate training in anatomy, physiology, pathology, and the other basic medical sciences which are necessary to the proper understanding of the specialty in question

(b) An active experience of not less than eighteen months in hospital clinics, dispensaries and diagnostic laboratories recognized by the Council and respective board as competent in the specialty.

(c) Examination by the respective board in the basic medical sciences of a specialty as well as in the clinical, laboratory and public health aspects

3 An additional period of not less than two years of study and/or practice

These essentials were adopted by the Advisory Board for Medical Specialties June 10, 1934 and have had only minor changes since then They are practically identical with an outline of Essentials for Approved Examining Boards in Specialties adopted June 10, 1934 by the Council on Medical Education and Hospitals of the American Medical Association and ratified June 11, 1934 by the House of Delegates of the American Medical Association

ORGANIZATION OF EXAMINING BOARDS

The foregoing essentials for approved special examining boards were followed in the organization of the existing boards

Official sponsorship of the national societies, and the related section of the American Medical Association, in a specialty organizing an examining board, has included the election or appointment of representatives from each of these national societies to serve on the board as examiners and directors

· Each board was or is incorporated Each application for organization and approval included.

1 The name of the proposed board

2 A statement of its method of organization, the sponsoring societies, its list of officers, and the names and addresses of the elected or appointed members of the board, including the societies which each represents

3 A copy of the tentative constitution and by-laws

4 A copy of its proposed articles of incorporation

5 An outline of qualification requirements for applicants

6 Approximate number of institutions offering residency training in the specialty and total number of residencies available.

7. An outline of proposed methods of examination.

8 A copy of the application blank

9. Any general information or statement of importance

10 Approximate number of physicians practicing the specialty which the board represents

These data are submitted in duplicate to the office of the Secretary of the Advisory Board for Medical Specialties

An application for election to membership in the Advisory Board and the data listed above are referred immediately for review by the Committee on Standards and Examinations of the Advisory Board On approval by the committee incorporation is then completed and a statement of this filed with the secretary Action on the application will be taken at the succeeding meeting of the Advisory Board for Medical Specialties and each examining board as elected will be recommended to the Council on Medical Education and Hospitals of the American Medical Association for official recognition One of the two sets of data submitted is forwarded to the Council on Medical Education and Hospitals of the American Medical Association with the Advisory Board's recommendations Examination and certification of applicants in the specialty may begin immediately when the special board is given such approval

Communications should be addressed to the secretary

CONSTITUTION AND BY-LAWS

Adopted at Organization Meeting, February 11, 1934

Article I

Name

The name of the organization shall be "The Advisory Board for Medical Specialties"

Article II

Purpose

This board shall act in an advisory capacity to such organizations as may seek its advice concerning the coordination of the education and certification of medical specialists N action taken by this Board shall be binding upon any member organizations

Article III

Membership

Section I

This board shall be composed of two representatives from each of the examining boards of the medical specialties and such other national organizations as are interested in education, examination, or certification of medical specialists

Section II —Original Membership

At the time of the organization, this board shall be composed of representatives from each of the following bodies

American Board of Ophthalmology
American Board of Otolaryngology
American Board of Obstetrics and Gynecology
American Board of Dermatology and Syphilology
Association of American Medical Colleges
National Board of Medical Examiners
Federation of State Medical Boards
American Hospital Association
Council on Medical Education and Hospitals of the American Medical Association

Section III—Additional Membership

To be eligible for representation in this board an examining board in a specialty must be composed of members elected from or appointed by societies recognized by this board as national societies in that specialty together with representation from the related Section of the American Medical Association Upon being accepted by this Advisory Board the board in question will be recommended to the American Medical Association as being qualified for recognition by that Association

Section IV—Quorum

A quorum at any meeting shall consist of a majority of the official representatives to the board and at least one third of the membership organizations shall be represented Each member organization shall be entitled to two votes

Article IV

Officers and Standing Committees

Section I—Officers

The officers of this board shall be (a) President, (b) Vice President, (c) Secretary Treasurer. *These officers shall be elected at the annual* meeting each year.

Section II—Standing Committees

The standing committees shall be as follows:

1. The Executive Committee
2 Standards and Examinations
3 Finance

The Executive Committee shall consist of the President, Vice President, Secretary Treasurer, and two members elected at the annual meetings No organization should have more than one member on the Executive Committee The President shall be the Chairman of the Executive Committee. The other standing committees shall be appointed by the President.

Article V

Amendments to the Constitution

Amendments to this constitution may be made by a majority vote of the official representatives present at any annual meeting provided that thirty days' notice of the proposed amendment has been given each member of the board

---

BY-LAWS

Article I

Duties of Officers

Section I

The President shall preside at all meetings of the board, shall act as Chairman of the Executive Committee, and shall appoint all other standing committees He shall call meetings of the Executive Committee at such time and place as may be deemed necessary

Section II

The Vice President shall assume the duties of the President in his absence

Section III

The Secretary Treasurer shall perform the usual duties of this office

Article II

Executive Committee

The Executive Committee shall carry out the policies and activities decided upon by the board It shall have *ad interim authority to initiate* policies subject to approval by the board at the annual or any special meeting The two elected members shall serve for two years, the terms of office terminating in alternate years

Article III

Meetings

Section I

There shall be an annual meeting at such time and place as the board may determine A special meeting may be called by the president upon ten days' notice to all members stating time, place and purpose of such meeting The Executive Committee may present other business for consideration

Section II

The Executive Committee shall meet subject to the call of the President

Section III

Robert's Rules of Order shall be followed except where they conflict with this Constitution and By Laws

Article IV

Amendments to the By Laws

Amendments to these by laws may be made at any regular or special meeting of the board

SATURDAY, AUGUST 16, 1947

TRENDS IN MEDICAL EDUCATION

In this issue of The Journal the report of the Council on Medical Education and Hospitals reveals several trends in the field of medical education. Topics that need special comment are the continuation of the accelerated program, the number and academic performance of veteran medical students, the number of women students, premedical requirements, admission policies and the development of new medical schools.

Early in 1946 most medical schools decided to discontinue the accelerated program adopted during the war and have now practically completed reconversion to prewar schedules. Seven of the four year schools, however, are continuing an accelerated schedule for all classes. Acceleration is required of all students in four of these schools and is voluntary in the other three. Many educators have felt that the numerous other difficulties that surrounded medical education during the war made it impossible to assess accurately the merits of the accelerated schedule. The experience under peacetime conditions of the seven schools that are continuing acceleration should provide valuable information for a more reliable appraisal of this educational experiment.

Veterans already comprise well over one half of the students enrolled in our medical schools. Only the 1946-1947 junior class had more nonveterans than veterans, and in that class the veterans were outnumbered by only 2.2 per cent. In next year's freshman class veterans will number over 70 per cent. From his performance in the 1946-1947 freshman class, it appears that the veteran is a somewhat better student than either his nonveteran classmates or the freshmen of prewar years.

During the past three years the number of women studying medicine in this country has almost doubled. In 1946-1947 women comprised 9.1 per cent of the total enrolment in the medical schools of the United States, an all time high. The highest percentage of women, 11.1, was in the freshman class. Present figures would indicate that in 1947-1948 somewhat fewer women will be counted among the entering students, although the estimated figure of 9 per cent is well above prewar levels.

During the war most schools lowered by a year or more the period of college training required of candidates for admission. There is now a distinct trend toward the reestablishment of the prewar requirements. Of the eighty-seven medical and basic science schools in the United States and Canada, seventy-five now require three or more years of premedical work. In some schools veterans may be admitted after a shorter period of college training.

A study of the geographic source of the students in the 1946-1947 freshman class reveals that a trend may be developing for medical schools, particularly those that are tax supported, to restrict admission to residents of the state or community in which they are located. If a definite trend in this direction occurs it may lead to unfortunate consequences for the individual schools and for medical education in general. Such a practice would result in a school's losing a number of outstanding students because they happened to be nonresidents, and it would also narrow the scope of the school's influence and support. Another evil would be to encourage the development of schools in states that are not in a position to establish and maintain acceptable medical schools. University administrators, public officials and others who have the authority to determine admission policies must be urged to maintain a long range view and not be stampeded by immediate pressures into adopting harmful expedients.

An expansion of the facilities for medical education in this country seems certain to occur during the next several years. One new medical school opened during the past year, and funds for initiating a building program were appropriated for another. Several basic science schools are considering expansion to a four year program, and plans for establishing several new medical schools are under discussion.

New medical schools, properly sponsored and with adequate financial support and access to the necessary amount of clinical material, are healthy developments in medical education. The new ideas and new opportunities that such institutions contribute have a real value. However, the development of a new medical school is a major undertaking that should not be started until it is clear that the requirements for establishing and maintaining an acceptable medical school can be fully met.

FINANCING MEDICAL EDUCATION

The cost of operating the medical schools of this country, exclusive of their teaching hospitals, will be somewhat more than $43,000,000 for the academic year 1947-1948 Less than one third of this sum will be obtained from student fees. The fact that during the coming year medical schools will receive more than $31,000,000 from endowments, general university funds, gifts and tax sources is good evidence of the determination of university administrators, trustees and legislators to continue to provide a program of high quality in the field of medical education. That such a policy results in a rich return to the people in health, happiness and economic productivity has been demonstrated by experience.

It is important, however, to point out that at least one fourth of our medical schools are still operating on grossly inadequate budgets and that the efforts of many more schools are limited by budgets that are but slightly less inadequate. The solution to the problem of how to increase the financial support of medical education is being urgently sought in many quarters

During the coming year medical school budgets will be supplemented by grants totaling about $10,000,000 from foundations, governmental agencies and other extra-university sources Relatively few of these grants are designed primarily to strengthen educational programs The majority are awarded for the prosecution of specific research problems

It cannot be denied that many grants for research benefit the educational activities of the institutions receiving them However, the question could be raised as to whether the fundamental cause of medical education and medical science would not be better served if more grants were available for the specific purpose of helping schools strengthen their educational activities

Those responsible for establishing and awarding grants should consider this problem. Medical schools and other educational institutions are having increasing difficulty in securing large unrestricted gifts or additions to endowments This situation may well make advisable a modification of policy in disbursing such funds as have already been accumulated by foundations and other agencies for the purpose of furthering medical science.

A policy of giving more direct financial support to the educational activities of medical schools can be fully justified Since effective research is the product of trained minds whose scientific curiosity has been stimulated, it is reasonable to believe that a greater investment by foundations and similar groups in improving the fundamental training of physicians as a class will ultimately bring a much larger return in scientific knowledge and scientific practice than will the expenditure of funds almost exclusively in support of the special activities of a few selected investigators

MEDICINE IN BRAZIL

Brazil is a country of amazing contrasts. Side by side the most modern and advanced in the science of medicine and in the practice of sanitation struggle against the lassitude of the tropics Hundreds of young men trained in the highly technical procedures of medicine in the institutions of North America endeavor with courage and sacrifice to overcome the imperturbable self-satisfied tradition of obsolete European technics of medical teaching and practice A score of medical societies, each with a few hundred members, waste the intellect and energies of their leaders in strife for individual political preferment; thus they remain ever subservient to varying governmental powers, when a consolidated medical opinion might speak with a voice to which government would listen

There are eleven medical schools in Brazil, of which not more than a few if any could qualify under the minimum standards established by the Council on Medical Education and Hospitals. The internship is practically unknown, although a few leading hospitals have established internships Schools of nursing are just beginning to be inaugurated; in many hospitals the family moves in with the patient to take care of his nursing. Tuberculosis constantly menaces the vast illiterate population, which includes between 70 and 80 per cent of Brazil's forty million people. Spitting is so common that even the newest hospital has special sputum basins in all the halls Tuberculosis of bones and joints and particularly of the spine is frequent The funds and institutions for its care are so inadequate to the need that most patients are subjected to fusion operations and a quick discharge from the hospital Apparently the majority of the patients who have had infantile paralysis come to scientific medical attention from two to ten years after their first paralysis, after deformity and distortion have reached their maximum Life expectancy for the population as a whole is quite certainly under fifty; but all the statistics relative to those outside the cities are subject to considerable doubt Heretofore most of the people have had misgivings about hospitals, conceiving of them as places to which one might be taken when in a morbid condition The postmortem examination in most institutions is virtually nonexistent Government is charged with graft, every evil of bureaucracy is exaggerated beyond belief; for instance, one hears that the great new hospital which does not open for three or four more months has already three hundred clerical employees on its permanent payroll Brazil has under twenty thousand physicians—probably fifteen thousand in practice—one doctor to three thousand people, great numbers of medical journals with maximum circulations around three thousand largely supported by uncontrolled advertisements. "Patent" medicines are sold without any apparent controls, and quick cures for syphilis are plugged on the radio. The newspapers are primitive, and even the one published in English carries solicitations by physicians. Any casual observer could multiply enormously these critical comparisons. Such destructive indictments, however, are little likely to lead to correction or advancement.

Through the office of the Institute of Inter-American Affairs vast benefit has already come to Brazil. Great areas have been freed from the menace of insect vectors of disease. Education of both the professions and the public in the fundamentals of hygiene and nutrition has been carried on with intelligence and good will. Since general provision of pure water, sewage disposal and similar public health projects is economically impossible, a beginning is made with safe wells and privies; the people in many areas have been quick to recognize their value and occasionally set up their own funds for extension of such projects. For this work there can be only encomium and a plea for its continuation and extension to the maximum of the means available.

The young men who have studied medicine in the United States need all the encouragement and help we can continue to give them after they return home to practice. Perhaps one or more generations will have to pass before the real significance of what they are doing will be recognized in their own country. In the meantime they battle against the status quo. The professorships in the medical schools are appointments made for life; the staff positions in most of the public hospitals are controlled by political influence; the small private hospitals are inadequate and commercial and subject to all the abuses that were only too well known in the United States during a similar period in our own evolution. Many of the young men trained in our own medical schools are reluctant to go into rural or frontier areas because of the lack of access to all the auxiliary medical services they used in the hospitals where they had their internships and residencies; a similar condition prevails in Brazil.

The extension of medical and public health projects from the United States to Latin America has served to introduce much of what is best in the medical science of the United States to millions of people who previously had little if any knowledge of the American way in medicine. Such movements as the Confederación Médica panamericana, the World Medical Association and the World Health Organization offer opportunity never previously available for emphasizing the international character of medical science and its leadership in promoting world peace.

THE INFLUENCE OF MEDICAL SCHOOLS ON GENERAL PRACTICE

Concern is being expressed in several quarters that too great a preponderance of recent graduates and students now in medical school are planning to become specialists and that not enough young physicians are interested in the practice of general medicine. It has been suggested that more discussion of the advantages and importance of general practice by the deans or other leaders in medical schools would result in more students being attracted to this field of medicine.

This question would seem to be part of the larger problem of providing medical students with more adequate information on the sociologic and economic aspects of medicine than has been done in the past. The fact that more and more medical schools are acknowledging this responsibility is definitely encouraging. It must be recognized, however, that many forces influence medical students in the choice of a career and that the point of view that a medical school fosters is only one of these forces.

Medical schools have also been urged to stimulate interest in general practice by encouraging their affiliated hospitals to develop internship and residency programs particularly designed to prepare men for the practice of general medicine. Several schools have already recognized the merit of this suggestion and are sponsoring such programs in their affiliated hospitals. Many who are close to the problem believe that, if more teaching hospitals would offer two year mixed or rotating services, a greater number of students would be encouraged to seek hospital appointments that would fit them for general practice.

The responsibility for the future of general practice falls on the public, the hospitals and the entire medical profession as much as it does on the medical schools. There is every reason to believe that the medical schools are prepared to take their share of the responsibility for preserving and strengthening this fundamental branch of medical practice.

Current Comment

THE POSTWAR RECORD OF MEDICAL EDUCATION

The statistics presented in the annual report of the Council on Medical Education and Hospitals on medical education in the United States and Canada reveal clearly the effectiveness with which medical education has adapted its activities to postwar needs. During the academic year 1946-1947 the total enrolment in the medical schools of this country was the second largest since 1905. The number of graduates, 6,389, was the largest reported for any single academic year since the Council on Medical Education and Hospitals was established. The number of freshmen enrolled was only 84 short of the largest freshman enrolment on record. From these figures it can be seen that the training and production of physicians is being maintained without interruption at the peak level of the effective capacity of our medical schools. This information should be of interest to veterans who have returned to their premedical studies and who have been concerned about a possible reduction in the opportunities for obtaining a medical education. Great efforts have also been exerted to provide opportunities for graduate study for veteran physicians desiring further training before entering practice. The number of approved residencies and fellowships in this country has been increased from 5,256 in 1941 to 12,003 in 1946-1947, an all time peak. Because of this expanded program the great majority of veterans have been able to secure within a relatively short interval after their separation from service opportunities for the additional training that they have desired. In considering the position of medical education in the postwar period, it should be observed that the average annual fee charged by medical schools in this country has increased only 21 per cent since 1940. This is a modest advance when compared with the increases in the costs of most other services and commodities during the same period. Thus, the record of medical education in fulfilling the demands of the postwar era can be favorably compared with the efforts and accomplishments of other groups in our society.

IMMUNIZATION WITH GAS GANGRENE TOXOIDS

Many attempts have been made to prepare immunizing agents against organisms of the gas gangrene group. In reporting the results of immunizing animals and human beings with gas gangrene toxoids, Tytell and his co-workers[1] state that potent toxin filtrates of Clostridium perfringens and Clostridium edematiens were used for the preparation of alum precipitated toxoids. These toxoids were tested on mice, guinea pigs, rabbits, goats, dogs and human volunteers and produced a measurable and protective titer of antibodies in animals. Good protection was obtained against multiple doses of toxin and bacterial culture. In animals protection was demonstrable against heterologous as well as homologous cultural strains. One dose of perfringens toxoid did not produce much rise in the antitoxin titers in human beings, but after two doses fairly good titers were evident in more than half. When a third dose was given three to nine months after the second, excellent titers were obtained in almost all of the human volunteers. Such titers were maintained for at least seven months. With perfringens toxoid good prospective titers were obtained with two doses, and excellent response after a third dose administered about four months after the second. Admixtures of the two toxoids were prepared. Good protective response to these mixtures was obtained in the experimental animals and in human beings after three doses. Reactions to these toxoids did not occur in the majority of volunteers. When they did they were as a rule not as severe as those produced by the alum precipitated toxoids of tetanus or diphtheria. These gas gangrene toxoids can be prepared on a commercial scale and have passed the safety tests outlined by the National Institute of Health.

SUCCESS AND FAILURE AMONG MEDICAL STUDENTS

Failure of a student to complete the medical curriculum successfully once he has entered medical school is wasteful in many respects. A recent analysis of psychiatric factors involved in the success or failure of medical students throws light on some factors involved in failure. Waggoner and Zeigler[1] tested 148 freshmen at the University of Michigan Medical School, using the revised Stanford Binet Form L, the Wechsler-Bellevue Adult Scale, the California Test of Mental Maturity, the Nelson-Denny Reading Test for High School and College Students, the Wrenn Study Habits Inventory, the Shipley-Hartford Retreat Test for Mental Deterioration and the Rorschach Examination. Of the 148, only 8 were dropped from medical school for academic failure, although 47 per cent incurred one or more grades of D. In addition, 9 students withdrew or dropped back one year for reasons of finance, health or poor grades. According to these investigators, no one test should be relied on to yield scores which can be trusted to predict academic success. Coordination of the results of more than one psychologic study with the results of the Rorschach Examination and adequate psychiatric interview when properly interpreted will yield information from which adequate selection of medical students can be made. In some, the psychologic studies show evidence of adequate intellectual ability in spite of which there is academic failure. In most such cases evidence of conflicting situations of one sort or another becomes apparent through psychiatric interview. Rorschach studies also frequently provide valuable information or leads which indicate the trend which should be taken by psychiatric interview. The most important factors in obtaining a satisfactory medical school record are of three types: (1) psychologic factors, such as intelligence, the ability to read rapidly and well, and vocabulary; (2) a personality structure which enables the students to sustain the emotional stresses associated with medical school work, and (3) a relative freedom from the situational stresses which produce conflict and reduce the student's efficiency. The Michigan investigators believe it advantageous to set an I. Q. limit of 130 on the Stanford Binet test merely because that is the dividing line between the lower and upper 80 per cent of students. They believe that the competition for students below the 130 will be severe both in medical school and after graduation. The single test most needed in this field, they believe, is one for motivation. A strong desire and interest in medicine is of great importance in satisfactory accomplishment both in school and thereafter. The importance of a reliable selection of students before entering the regular medical course is so obvious that a later follow-up of the students whose tests Waggoner and Zeigler summarize would be worth making and reporting.

Washington Letter

(From a Special Correspondent)

Aug 13, 1947

President Truman Vetoes Proposed Science Foundation

Using a pocket veto, President Harry Truman killed the bill to create a National Science Foundation composed of twenty-four members who would have been appointed by the President Mr. Truman declared that the foundation as described in this plan would be complex and unwieldy and would impede rather than promote scientific research in this country Critics attacked the contemplated part time board on the ground that a part time body should not have control of all activities concerned with government aid to science President Truman was criticized by proponents of the measure. Senator T Alexander Smith, Republican of New Jersey, said that the President had "set back the cause of science" ten years through the veto He accused Mr. Truman of having made a "political football" out of "what undoubtedly would have been the greatest contribution made to this country by any Congress since the turn of the century."

Construction Costs Blamed for Revision of Veteran Hospital Plans

General Omar N Bradley, veterans administrator, announced that drastic design revisions would have to be made in seventy-three proposed multi million dollar veterans' hospitals because of spiraling construction costs As a result there will be up to six months delays on the projects General Bradley said he found evidence that contractors were adding a 15 to 30 per cent "fear contingency cushion" to active construction bids. He said "Either we must modify the desirable but nonessential features of a substantial number of structures on the drawing boards or we may require as much as 100 million dollars in additional funds."

Increase in Mental Institutionalization Attributed to Housing Situation

The housing shortage was cited as one reason why 17 per cent more persons are being institutionalized for mental diseases this year than last. Dr. Winfred Overholser, head of St. Elizabeths Hospital, explained that old age is often accompanied with mental disease due to senility. People usually care for their old folk when they have room, but, with the housing shortage, relatives are now more inclined to allow institutionalization of the senile. Other reasons for the increase are return of service men to new situations in civilian life, letdown in the war stimulation and more general recognition that early care is advisable in mental diseases.

Army Proposes to Make Greater Use of Scientific Talents

The War Department announced that it will revise its classification system so that trained scientists can be placed in positions where better use can be made of their knowledge. Surveys revealed that the armed services did not make full use of scientifically trained manpower in the last war. Forty-seven per cent of younger scientists considered their know how had been used only to small advantage or not at all, while 75 per cent of older scientists believed their talents had been adequately used in war work

Coming Medical Meetings

American Association of Medical Record Librarians, New York, Hotel Commodore, Sept. 7-12. Mrs Adaline Hayden, 18 E. Division St, Chicago, Executive Secretary.

American Association of Obstetricians, Gynecologists and Abdominal Surgeons, Hot Springs, Va., The Homestead, Sept. 4-6. Dr. James R Bloss, 418 Eleventh St, Huntington 1, W Va, Secretary.

American College of Surgeons, New York, Waldorf-Astoria Hotel, Sept. 8-12. Dr. Paul B Magnuson, 40 E Erie St, Chicago 11, Secretary.

American Congress of Physical Medicine, Minneapolis, Hotel Radisson, Sept. 2 6 Dr. Richard Kovacs, 2 E. 88th St., New York 28, Secretary.

American Congress on Obstetrics and Gynecology, St. Louis, Municipal Auditorium, Sept. 8-12. Mr Karl S Richardson, 24 West Ohio St, Chicago, Business Manager.

American Roentgen Ray Society, Atlantic City, Sept. 16-19. Dr. H. Dabney Kerr, University Hospitals, Iowa City, Secretary

Colorado State Medical Society, Denver, Shirley Savoy Hotel, Sept 17-20 Mr Harvey T. Sethman, 1612 Tremont Place, Denver 2, Executive Secretary

International Cancer Research Congress, St Louis, Hotel Jefferson, 2 7 Dr. Axel N Arneson, 510 S Kingshighway, St. Louis, Chairman Committee on Local Arrangements.

International College of Surgeons, U S Chapter, Chicago, Palmer House, Sept 29 Oct 2 Dr. Louis J. Gariepy, 16401 Grand River Ave, Detroit 27, Secretary.

Medical Legislation

MEDICAL BILLS IN CONGRESS

National Science Foundation

The legislation proposing to establish a National Science Foundation, S 526, was passed by the Senate and House but was vetoed by President Truman August 6th This action of the President was predicated on the belief that the bill contained provisions which represent a marked departure from sound principles for the administration of public affairs *in that it would vest the determination of vital national policies, the* expenditure of large public funds, and the administration of important governmental functions in a group of individuals who would be essentially private citizens President Truman said that the Constitution places upon the President the responsibility for seeing that the laws are faithfully executed but that under the provisions of S 526, the President would be *deprived of effective means for discharging his constitutional responsibility* because full governmental authority and responsibility would be placed in 24 part time officers whom the President could not effectively hold responsible for proper administration Neither could the Director be held responsible by the President, for he would be the appointee of the Foundation and would be insulated from the President by two layers of *part time boards* President Truman *expressed the hope that the Congress* will reconsider this question and that it will enact a basically sound law early in its next session.

Army-Navy-Public Health Service Medical Officer Procurement Act of 1947

A bill sponsored in the Senate by the Senate Committee on Armed Services, S 1661, has passed the Senate and House, proposing to provide additional inducements to physicians, surgeons and dentists to make a career in the United States military, naval and public health services Under this bill commissioned medical and dental officers of the Army, Navy and Public Health Service will be given extra pay at the rate of $100 per month in addition to their base and longevity pay, except that officers commissioned in the medical and dental corps of the Officers' Reserve Corps, the Naval Reserve, the National Guard, the Army of the United States or medical and dental officers of the Reserve Corps of the Public Health Service will receive the increase only provided that within a period of five years they volunteer and be accepted for extended active duty of one year or longer and then only during periods of volunteer service Authority is also given the President to make original appointments to permanent commissioned grades, with rank not above colonel in the medical and dental corps of the Army and not above that of captain in the medical and dental corps of the Navy in such numbers as the needs of the services may require, the appointments to be made from qualified civilian doctors of *medicine* and dentists The *President* has approved this legislation.

GOVERNMENT SERVICES

ARMY

GENERAL BLISS INSPECTS HOSPITALS IN GERMANY

The Surgeon General of the Army, Major Gen. Raymond W. Bliss, has just returned from inspecting American military medical establishments in Germany. The Surgeon General has in mind setting up a residency training program for young American Army doctors now stationed in Germany which would be not only of value to the officers but of help in the increasingly serious German medical situation General Bliss pointed out that the U. S. Army has a hospital with 750 patients in the same immediate area in which is a German children's hospital with more than 500 patients. He feels that better advantage should be taken of the clinical opportunities present and that some kind of residency program should be worked out. There is in Germany apparently an extreme shortage of everything needed to care for the sick.

DEADLINE FOR REGULAR ARMY COMMISSIONS FOR NURSES

The War Department has announced that the time limit for applicants seeking Regular Army commissions in the Nurse Corps and the Women's Medical Specialist Corps has been extended to September 30. Applicants for the Regular Army Nurse Corps must be unmarried registered nurses with previous military service, have no dependents under 14 years of age, and be between the ages of 21 and 35 years of age. For commissions in the Medical Specialist Corps applicants must be in the 21 to 45 age group, unmarried and have no dependents under 14 years of age. Application forms may be secured at army hospitals, army headquarters, state and district nursing associations or from the Surgeon General's Office, Washington, D. C.

MORE NURSES NOMINATED FOR COMMISSIONS

President Truman sent to the Senate for confirmation the names of 427 army nurses who have been nominated for permanent commissions in the Regular Army Nurse Corps. On that list 120 were recommended for appointment as captains and 307 for appointment as first lieutenants. If and when confirmed by the Senate, the authorized strength of the new Regular Army Nurse Corps will be 500. The authorized strength has been set as 2,558.

RESEARCH ON HEPATITIS

The U. S. Army in Germany has taken over one of Hitler's "Youth Through Joy" hospitals at Bayreuth in Bavaria, which will be used as a research center for the study of infectious hepatitis. A laboratory for this research study has been set up in the University of Heidelberg. The study is being carried out under the direction of the Commission on Virus and Rickettsial Disease of the Army Epidemiological Board.

MEETING OF MEDICAL OFFICERS IN KOREA

The first periodic meeting of U. S. Army medical officers in Korea was held at the 34th General Hospital at Seoul, July 15. About one hundred officers attended. Among the papers read were the diagnosis and treatment of common dermatologic diseases by Capt. Woodrow W. Murphy of the 34th General Hospital, and rheumatic fever in Korea by Capt. Arnold G. Blumberg. The discussers were Capts. Lee Russell of the 377th Station Hospital and James H. Allison of the 382d Station Hospital. In addition to the scheduled program Dr. William McD. Hammon of the Army Epidemiological Board presented a film on arthropod borne virus encephalitides, with special emphasis on Japanese B encephalitis. The chairman of the scientific meeting was Major William B. Draper, chief of medical service, 34th General Hospital, who introduced Lieut. Col. John J. Marren, commanding officer of the hospital, and Col. William D. Willis, corps surgeon.

CIVILIAN PERSONNEL NEEDED FOR WORK IN JAPAN

The War Department is recruiting civilian personnel for work with the military government, Eighth Army, in Japan, and needs immediately the following competent personnel: a bacteriologist, senior chemist and assistant venereal disease control officer (M.D.), with annual salaries of $7,381.50; also a sanitary engineer at $6,127.50. Other positions of similar types frequently are available. Persons interested should write to the War Department Special Staff, Civil Affairs Division, Personnel and Training Branch, Washington 25, D. C.

HEALTH IN JAPAN

In his report to the War Department for the March-April period General MacArthur stated that the increase in malaria in the Ryukyus persisted with 8,432 cases reported, while the number of cases of trachoma and influenza in Okinawa decreased to 5,597 and 2,414 respectively. Meanwhile the training of nurses continued with fifty girls being selected for the first year nursing course at the three Okinawa hospitals. The March 1 census of the Ryukyus showed that 833,074 persons inhabited the islands. The number of Ryukyuans repatriated by April 27 totaled 207,967.

ARMY AWARDS AND COMMENDATIONS

Colonel Edward S. Murphy

The United States of America Typhus Commission Medal has been awarded to Col. Edward S. Murphy, M. C., A. U. S., of Missoula, Mont. The citation read as follows: As assistant surgeon, First Army, from March 6 to May 8, 1945 in Germany, he exhibited keen professional ability and untiring effort in connection with the work of the United States Typhus Commission in the investigation, prevention and control of the spread of the deadly disease among American troops and countless thousands of civilian personnel in the occupied area. His organization of efficient control groups and institution of prompt preventive measures were responsible for the low incidence of typhus in his command. Dr. Murphy has also been awarded the Bronze Star and the Purple Heart. He graduated from Creighton University School of Medicine, Omaha, in 1916 and entered the military service in the recent war in September 1942.

Captain Vincent A. Spinelli

The Army Commendation Ribbon has been awarded to Capt., later Major, Vincent A. Spinelli, M. C., A. U. S., now of White Plains, N. Y. The citation signed by Brigadier Malcolm C. Grow read in part as follows: Captain Spinelli is highly commended for outstanding performance of duty as convalescent services personal physician, AAF Convalescent Hospital, Fort Logan. During the period Jan. 24, 1945 to Sept. 19, 1945 as a personal physician to a group of convalescent patients he performed his duties in a most outstanding manner. The sincerity in which he cared for his patients contributed immensely to the high standards which his hospital maintained. Dr. Spinelli graduated from the New York Medical College, Flower and Fifth Avenue Hospitals, New York, in 1939 and entered the military service in June 1941.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

ARKANSAS

Reorganize Administration of Medical School.—In a reorganization of administration of the University of Arkansas School of Medicine, Little Rock, Dr. Henry C. Chenault, dean, has been made vice president of the university in charge of medical education and hospitalization, and Dr. Benjamin B. Wells, associate professor of medicine, has been appointed dean of the medical school. Dr. Chenault has served as dean since last October. Dr. Wells, a graduate of Baylor University College of Medicine, Houston, 1935, was associated with the Carnegie Institution, Washington, as an investigator, 1941-1942, before coming to the university. From 1936 to 1939 he was an instructor in physical chemistry at Baylor University College of Medicine. A plan has been advanced for the revision and expansion of the staff and departments of the medical school with the employment of full time personnel. All divisions will have permanent department heads and staffs who will continue to use the services of part time specialists. The plan was developed with the cooperation and in accordance with recommendation of the Arkansas Medical Society and national medical authorities, President Lewis W. Jones said. The reorganization will allow for the integration of premedical and medical education programs. Staff appointments and policies will be approved by the university president in contrast to the situation in past years, in which the medical school has been practically autonomous. Other objectives of the program include the development of postgraduate teaching in various specialties of medicine and surgery in cooperation with the Arkansas Medical Society, a postgraduate training program coordinated with the medical school leading to advanced degrees in basic sciences related to medical and surgical sciences, a cooperative program of specialty training in hospitals throughout the state and a nurses training school where students may obtain a bachelor degree in nursing.

COLORADO

State Medical Meeting at Denver.—The seventy-seventh annual session of the Colorado State Medical Society will be held at the Shirley-Savoy Hotel, Denver, September 17-20, under the presidency of Dr, Archie C. Sudan. Among others, the following out of state speakers are on the program:

James B. Brown, St. Louis, Neck Dissection for Metastatic Carcinoma.
Creighton Barker, New Haven, Conn., Objectives of Modern State Medical Societies.
J. William Hinton, New York, Acute Abdominal Pain: Its Surgical Significance.
Robert J. Crossen, St. Louis, Advances in Diagnosis and Treatment of Cancer of Uterus.
James B. Brown, St. Louis, Limitations and Possibilities in Plastic Surgery.
James J. Boyle, Washington, D. C., The Politicomedical Scene in Washington.
Emery A. Rovenstine, New York, The Influence of Anesthetic Agents on the Peripheral Circulation During Hemorrhage.
Lieut. Col. Michael Buscemi, M. C., Los Alamas, N. M., Role of Radioactive Isotopes in Clinical Medicine.

At the close of the scientific sessions each afternoon a question hour will be conducted with guest speakers and Colorado essayists available to answer questions from the audience. The house of delegates will meet Wednesday morning. All sports events will be conducted Wednesday afternoon. The Woman's Auxiliary will celebrate its silver anniversary September 18-20 with headquarters at the Albany Hotel. The annual banquet and dance will be held Saturday at 7: 30 p. m.

DISTRICT OF COLUMBIA

George Washington Promotions.—George Washington University School of Medicine has announced the promotion of Dr. James W. Watts to a full professorship in neurologic surgery. Other promotions include those of Dr. Clayton B. Ethridge, who was made an associate clinical professor in medicine, Dr. John H. Lyons a clinical professor of surgery, Dr. Henry Rappaport a professorial lecturer of pathology, Ira R. Telford, Ph.D., an associate professor of anatomy and Carlton R. Treadwell, Ph.D., an associate professor of biochemistry.

GEORGIA

Seminar in Obstetrics.—At the University of Georgia School of Medicine, Augusta, an obstetric seminar will be held September 1-6 under the guidance of the directors of maternal and child health of Georgia and South Carolina, Dr. Guy V. Rice Jr., Albany, and Dr. Hilla Sheriff, Columbia, respectively. The lecturers will be seventeen specialists certified by the Board of Obstetrics and Gynecology. Two diplomates of allied specialties will also participate. Attendance will be limited to physicians of Georgia and South Carolina.

Poliomyelitis Conference at Warm Springs.—Marking the twentieth anniversary of the founding of Georgia Warm Springs Foundation, a three day clinical conference on diagnosis and treatment of poliomyelitis will be held at Warm Springs September 15-17. About twenty of the nation's authorities in the fields of neurology, pathology, pediatrics, orthopedics, physical medicine and internal medicine will present papers reviewing the advances in knowledge of poliomyelitis. The papers and discussions will constitute a new book on diagnosis and treatment of the disease for publication in 1948. Clinical demonstrations of modern methods of treatment will be given by the medical staff of the Warm Springs Foundation. Physicians interested in attending this conference should make inquiries to the Georgia Warm Springs Foundation, 120 Broadway, New York 5. A complete program of the meeting will be available on request.

MICHIGAN

Five Veteran Physicians Honored.—The St. Clair County Medical Society honored five "fifty year" physicians at its annual spring dinner meeting in St. Clair in June. They were Drs. James A. Attridge, Albert L. Callery, both of Port Huron; Aaron B. Armsbury, Marine City; Christopher McCue, Goodells, and William G. Wight, Yale.

Health Department Merger.—Lansing Health Department and the county health unit consolidated July 1, and authority over the Lansing group was transferred to the Ingham County board of supervisors. Dr. Roelof Lanting, director of the Lansing health department, became the director of the city-county. unit. Under the merger, much of the duplication of effort in sanitary work is expected to be eliminated. The organization will also be entitled to larger state and federal aid since the merger. The health committee of the board of supervisors will act as a policy making authority for the time being.

NEW HAMPSHIRE

Eye Institute Closes.—The Dartmouth Eye Institute, Hanover, has terminated all clinical activities "because of an inability to provide a sound financial basis for future activities," the managing trustee, John Pearson, has announced. The clinic was established in 1921 when Professor Adelbert Ames Jr. undertook the study of problems of visual optics. The current work of Professor Ames in visible perception continues under the auspices of the Hanover Institute. Professor Ames, who once practiced law, has been research professor of physiologic optics since 1919. In 1921 he was a member of the committee on physiologic optics of the National Research Council. Professor Ames and his fellow worker Gordon H. Gliddon presented a paper on "Ocular Measurements" before the Section on Ophthalmology at the annual meeting of the American Medical Association in 1928 in Minneapolis, which paper was published in the transactions of the section.

NEW YORK

Postgraduate Instruction.—The Medical Society of the State of New York and the New York State Department of Health have arranged two programs of postgraduate instruction at the County Hospital, Cortland. Dr. Carl H. Greene, clinical professor of medicine, Long Island College of Medicine, Brooklyn, will speak on "Nephritis," September 19 at 8: 30 p. m., and Dr. William Dock, professor of medicine at Long Island College of Medicine, on "Peptic Ulcer and Gastric Cancer," October 17 at 8: 30 p. m. For the Broome County Medical Society, Dr. Franz Altmann, assistant clinical professor of otolaryngology, Columbia University College of Physicians and Surgeons, New York, will speak on "Ménière's Syndrome and Related Conditions" at the Binghamton City Hospital, November 11 at 8: 30 p. m.

New York City

Mr. Rockefeller Gives Entire Block to Hospital.—Memorial Hospital for the Treatment of Cancer and Allied Diseases has received an entire block as a gift from John D. Rockefeller Jr. It is bounded by Second and Third avenues and 68th and 69th streets. The property has an estimated value of $3,500,000. In 1936 Mr. Rockefeller donated the block on which the hospital now stands.

Tuberculosis Survey Reveals Active Cases.—Community x-ray surveys conducted in Queensboro by the Queensboro Tuberculosis and Health Association revealed 13 active cases of tuberculosis. The annual report made June 21 stated that the association had x-rayed 30,707 persons from April 1946 to March 1947. The 13 patients with active tuberculosis were hospitalized through association workers.

To Lecture in South America.—Dr. Arthur W. Grace, professor of clinical dermatology and syphilology, Long Island College of Medicine, Brooklyn, left July 27 for a seven week lecture tour of South America, sponsored by the E. R. Squibb & Sons Inter-American Corporation and the Squibb Institute for Medical Research. Dr. Grace will discuss modern methods of diagnosis and treatment of skin and venereal diseases. He will visit hospitals and universities in six Latin American countries. A graduate of the University of London, England, Dr. Grace has been on the faculty of the Long Island College of Medicine since 1931. He is a former special consultant in venereal diseases to the United States Public Health Service and assistant attending physician to the New York Hospital.

NORTH DAKOTA

Dr. Lawton Appointed Dean. — Dr. Alfred H. Lawton, assistant professor of medicine and assistant professor of physiology and pharmacology at the University of Arkansas School of Medicine, Little Rock, since last September, has been appointed dean of the University of North Dakota, Grand Forks. Dr. Lawton, a native of Iowa, received his medical degree at Northwestern University Medical School, Chicago, 1941, interned at Passavant Memorial Hospital and held a residency at Henry Ford Hospital, Detroit. He has been an officer of the U. S. Public Health Service for four and one-half years, doing research at the National Institute of Health, Bethesda, Md.

OHIO

University Appointments.—Dr. Richard L. Meiling, formerly of Western Reserve University School of Medicine, Cleveland, has been appointed part time assistant professor in obstetrics and gynecology. He received his medical degree from the University of Munich. Dr. Meiling entered the army in 1940 and served as air evacuation officer and executive officer, Office of the Air Surgeon. He was awarded the Legion of Merit.

Appoint Five Department Heads at Cincinnati.—The University of Cincinnati College of Medicine has appointed Dr. Leon Goldman professor of dermatology and syphilology and director of the department at the Cincinnati General Hospital. Dr. Goldman graduated at the University of Cincinnati College of Medicine, 1929, where he was an assistant professor. He has served as a consultant to the United States War Department and to the National Research Council. Dr. Stanley Garber was appointed professor of obstetrics and director of the hospital's department of obstetrics. Dr. Garber has been an assistant professor. He is a graduate of Harvard Medical School, Boston, 1934, and has served on hospital staffs in Boston and Cincinnati. Dr. Donald J. Lyle was appointed professor of ophthalmology and director of the hospital's department of ophthalmology. A graduate of the University of Cincinnati College of Medicine, 1919, he has been on the staff of the Good Samaritan Hospital, Christ Hospital, Children's Hospital, Jewish Hospital and St. Mary's Hospital, and instructor in anatomy at the university. Dr. Henry M. Goodyear was appointed professor of otolaryngology and director of the hospital's department of laryngology. A graduate of Northwestern University Medical School, 1915, he has been a staff member of Cincinnati hospitals and an associate professor at the university. Dr. Charles D. Aring, formerly associate professor in neurology at the University of Cincinnati College of Medicine, has been appointed the new Albert Barnes Voorheis professor of neurology and director of neurology at the Cincinnati General Hospital, effective September 1. He received his medical degree at the university in 1930 and, following residencies in Boston hospitals, studied in England, Madrid and Breslau as a Rockefeller fellow in neurology. He was an associate professor of neurology from September 1936 to 1946 and returns to Cincinnati following a year as professor of neurology at the University of California, San Francisco.

OKLAHOMA

State Medical Election.—At the annual meeting of the Oklahoma State Medical Association last May Dr. Paul B. Champlin, Enid, became president, Dr. Clarence E. Northcutt, Ponca City, president-elect and Dr. Lewis J. Moorman, Oklahoma City, secretary.

New Orthopedic Society.—A group of orthopedists met in Tulsa last May to form the Oklahoma Orthopedic Society for the furtherance of orthopedic surgery in the state. It will hold two meetings a year. Membership in the American Board of Orthopedic Surgery makes a physician eligible to the society. Officers elected were Dr. Don H. O'Donoghue, Oklahoma City, president, Dr. Frank A. Stuart, Tulsa, vice president, and Dr. Samuel T. Moore, Oklahoma City, secretary-treasurer.

VIRGINIA

Director of Division of Cancer.—Dr. Mason Romaine, Petersburg, became director of the division of cancer control of the state health department July 1. A graduate of the University of Virginia Department of Medicine, Charlottesville, 1917, he was appointed full time public health officer in Petersburg in 1941, after having been associated with the department since 1922.

To Establish Mission Hospital in Korea.—Dr. Paul S. Crane, temporarily of Richmond, will leave shortly to establish a mission hospital in Korea under the auspices of the Southern Presbyterian Foreign Mission Committee. He will be joined by his father, Dr. J. C. Crane, who has spent many years as a Presbyterian missionary in Sunchon, Korea, site of the new hospital. Dr. Crane received his medical degree from Johns Hopkins University School of Medicine, 1944. Since his release from army service he has been gathering equipment and supplies for his undertaking.

Dr. Rudolph Holmes Gives Library to University.—Dr. and Mrs. Rudolph W. Holmes of Charlottesville, formerly of Chicago, have presented their library, chiefly on obstetrics and gynecology, to the University of Virginia Medical Library as a memorial to their respective mothers, Paula Wieser Holmes and Sarah Moore Baxter. The collection includes about 1,000 items dating from the early seventeenth century, comprising textbooks and monographs in English, German and French which offer a comprehensive historical survey of the subjects to recent times. Dr. Holmes formerly was professor of obstetrics and gynecology at Rush Medical College, Chicago, and since 1926 has been professor emeritus, University of Chicago, and more recently of the University of Illinois.

WEST VIRGINIA

First Mass X-Ray Program.—The first mass x-ray study in West Virginia is scheduled for Clarksburg beginning September 8. The program is being launched by the state health department as part of the campaign against tuberculosis. Efforts will be made to make roentgenograms of all persons over school age in Clarksburg. The direct sponsors will be the Harrison County Tuberculosis and Health Association. Participating agencies, besides the state health department, will include the Harrison County Medical Society and Auxiliary, local city and county health departments, the school board, nurse's aides and various service clubs and civic organizations. According to Dr. Newman H. Dyer, Charleston, state health commissioner, Clarksburg has been selected for this demonstration because it has one of the oldest local tuberculosis associations in the state and also has adequate facilities for diagnosis and follow-up. One of the seven permanent diagnostic clinics is located in that city. Volunteer workers will make a house to house canvass to obtain signatures of persons desiring to be examined. Besides offering free x-ray service to those desiring a check for tuberculosis, the state health department will give tuberculin tests to school children, and those with a positive reaction will have roentgenograms. If the survey at Clarksburg is successful, the state department plans to conduct similar studies in other West Virginia cities.

WYOMING

Dr. Yoder Appointed State Health Officer. — Dr. Franklin D. Yoder, Cheyenne, has been appointed director of the state department of public health. He will attend the University of California at Berkeley to take a course in public health administration and will assume his new position July 1, 1948. Dr. Yoder, who graduated from Northwestern University Medical School, Chicago, in 1939, served as a flight surgeon in the Army of the United States in the recent war.

GENERAL

College of Surgeons Clinical Congress.—The thirty-third annual clinical congress of the American College of Surgeons, including the twenty-sixth annual hospital standardization conference, will be held at the Waldorf-Astoria, New York, from September 8 to 12. The five day program features operative and nonoperative clinics in thirty-eight hospitals and scientific sessions in general surgery and surgical specialties. Dr. Allen O. Whipple, New York, will deliver the second Martin Memorial Lecture, on "The Qualifications of the Surgeon and the Cancer Problem." Dr. Arthur W. Allen, Boston, will be inaugurated president.

Scholarships for Training in Cerebral Palsy.—Scholarships totaling $5,000 a year for graduate study to aid the cerebral palsied were voted recently by the national council of Alpha Chi Omega, to be administered by the Cerebral Palsy Division of the National Society for Crippled Children and Adults, Inc. Graduate scholarships will be given to physicians, therapists and special education teachers. The allotment will cover maintenance and tuition for study at a recognized training center for a minimum of three months. Recipients will be selected by the National Society's cerebral palsy medical advisory committee and the Cerebral Palsy Division.

Special Society Elections.—At the annual meeting of the American Broncho-Esophagological Association Drs. Millard F. Arbuckle, St. Louis, was elected president, Paul H. Holinger, Chicago, secretary and Clyde A. Heatly, Rochester, N. Y., treasurer.——At the thirteenth annual meeting of the American College of Chest Physicians, June 5-8, the following physicians were elected: Major Gen. Shelley U. Marietta, (Ret.), Washington, D. C., president; Dr. Richard H. Overholt, Brookline, Mass., president-elect, and Dr. Benjamin L. Brock, Evanston, Ill., secretary-treasurer.——Officers of the American Neurological Association for 1947-1948 are Dr. George Wilson, Philadelphia, president; Dr. Harold G. Wolff, New York, first vice president; Dr. H. Houston Merritt, Bronxville, N. Y., secretary-treasurer.

Propose World Federation of Clinical Pathologists.—At a meeting of the European Association of Clinical Pathologists in Cambridge, England, June 27, this organization reconstituted itself as a world federation of constituent bodies. The meeting, which was attended by representatives of various countries, including France, Great Britain, Norway, Russia and Czechoslovakia, appointed a committee to call a meeting of delegates next November in Paris with the view of formulating a constitution and electing officers. The aims of the world federation, according to Dr. Sidney C. Dyke, F.R.C.P., are to develop further clinical pathology and its allied sciences, to have regard for the scientific and professional status of those engaged in its study and practice, and to foster international good will. Societies throughout the world are invited to communicate with the joint secretaries of the federation committee, either Dr. William H. McMenemey, Pathological Department, the Royal Infirmary, Worcester, or Dr. Joseph Ungar, Greenford, Middlesex, England.

Reopen Peiping Union Medical College.—The new board of trustees of the China Medical Board, Inc., which has been organized since termination of all relationship between the board and the Rockefeller Foundation, announced plans July 1 for reopening the Peiping Union Medical College. In a statement the board emphasized the objectives of the assumption of responsibility by the Chinese faculty and staff of the college and development in China of financial support. Although the Peiping Union Medical College and the China Medical Board, Inc., are separate and distinct corporate entities, the board owns the college buildings and equipment, which it leases for a nominal sum, but the trustees of the college are responsible for its administration and educational policy. The board will continue to support the college and its program. The Peiping Union College was founded in 1906 by a group of mission boards. The China Medical Board was created in 1915 as a division of the Rockefeller Foundation but became a separate organization in 1928. The decision to end all connection between the two was announced last January (THE JOURNAL, February 22, p. 564).

Annual Postgraduate Course in Chest Diseases in Chicago.—The American College of Chest Physicians will conduct its second annual postgraduate course in diseases of the chest September 15 to 20 at the Municipal Tuberculosis Sanitarium, Chicago. The out of state participants include Andrew L. Banyai, associate clinical professor of medicine, Marquette University School of Medicine, Milwaukee; Alvan L. Barach, associate professor of clinical medicine, Columbia University College of Physicians and Surgeons, New York; Alvis E. Greer, professor of clinical medicine, Baylor University College of Medicine, Dallas; John B. Grow, thoracic surgeon, National Jewish Hospital, Denver; Milton I. Levine, assistant professor of clinical pediatrics, Cornell University Medical College, New York; Jay A. Myers, clinical professor of medicine and public health, University of Minnesota Medical and Graduate Schools; George G. Ornstein, associate professor of medicine, New York Medical College, Flower and Fifth Avenue Hospitals, New York; J. Winthrop Peabody, professor of diseases of the respiratory system, Georgetown University School of Medicine, Washington, D. C.; Karl H. Pfuetze, medical director, Mineral Springs Sanatorium, Cannon Falls, Minn., and Oscar A. Sander, studies in occupational diseases and industrial case findings.

Prevalence of Poliomyelitis.—Reports of cases of poliomyelitis for the periods indicated have been received from the division of public health methods, U. S. Public Health Service:

CORRECTION

Epinephrine for Bandl Ring Contraction.—In the answer to the query and minor note in THE JOURNAL, July 12, 1947, page 985, the metric equivalent in the parenthesis for 6 to 8 minims should have been given as 0.4 to 0.5 cc.

Deaths

Edward Robinson Baldwin ⊕ Saranac Lake, N. Y., died May 6, aged 82, of bronchopneumonia. Born in Bethel, Conn., Sept. 8, 1864, Dr. Baldwin graduated at Yale University School of Medicine, New Haven, in 1890 and served an internship at the Hartford Hospital before beginning practice at Cromwell, Conn., in 1891. For many years he was associated with the Saranac Laboratory, where in 1892 he became an assistant and later director, serving until 1926. He had been a trustee and since 1916 chairman of the executive committee of the Trudeau Sanatorium, its vice president from 1916 to 1934 and honorary president since 1945. Dr. Baldwin instituted the Trudeau School of Tuberculosis in 1916 and was for many years director of the Trudeau Foundation. He was a past president of the American Climatological and Clinical Association and of the National Tuberculosis Association, a member of the Association of American Physicians and the American Society for Clinical Investigation, the American Association of Pathologists and Bacteriologists and the New York Academy of Medicine, and honorary life member of the Tuberculosis Society of Scotland. He was president of the Saranac Lake Board of Health from 1898 to 1901 and then for many years was president of the Reception Hospital for Tuberculosis. In 1918 he was contract surgeon for the tuberculosis consulting examination board at Camp Devens and a delegate of the League of Red Cross Societies to the 1919 conference in Cannes, France. At the time of his death he was a trustee of the Saranac Lake General Hospital. In 1916 with the late Dr. Walter B. James he inaugurated the Edward Livingston Trudeau Foundation, which engaged in tuberculosis research and teaching. In 1920 he served on the medical advisory board of the U. S. Public Health Service and from 1930 to 1940 on the consulting medical board of the U. S. Veterans Bureau. He had been a member of the tuberculosis committee of the New York State Health Commission since 1931, a member of the Saranac Lake School Board District No. 1, and director of the Adirondack National Bank. Dr. Baldwin was awarded the honorary degree of master of arts from Yale in 1914 and doctor of science from Dartmouth in 1937. In 1927 the National Tuberculosis Association awarded him the Trudeau Medal. In 1936 he received the Kober Medal from the Association of American Physicians. He was editor emeritus of the *American Review of Tuberculosis*, author of many scientific papers on tuberculosis, co-author of "Tuberculosis, Bacteriology, Pathology and Laboratory Diagnosis" and a contributor to Osler's System of Medicine.

Ernest Granville Crabtree ⊕ Boston; born in Zanesville, Ohio, 1883; Harvard Medical School, Boston, 1914; specialist certified by the American Board of Urology, Inc.; instructor in urology at the Harvard Medical School, Courses for Graduates; member of the New England Obstetrical and Gynecological Society, New England Surgical Society, American Association of Genito-Urinary Surgeons and the American Urological Association, of which he was president-elect; past president of the Massachusetts Society for Social Hygiene; fellow of the American College of Surgeons; served with the British army during World War I; on the staffs of the New England Baptist, Beth Israel and Boston Lying-In hospitals in Boston and the Newton-Wellesley Hospital in Newton; died in Sharon, Vt., May 30, aged 63, of coronary disease.

William West Sutherland ⊕ Ridgewood, N. J.; born in Jackson, Mich., Sept. 10, 1898; University of Oregon Medical School, Portland, 1925; specialist certified by the American Board of Obstetrics and Gynecology, Inc.; served during World War I; during World War II served in the Pacific for twenty months in the medical corps of the U. S. Naval Reserve and had been medical officer of service squadron 12, Pacific Fleet, which saw action in the Mariannas, Palau, Iwo Jima and Okinawa; held the rank of commander when his service terminated in March 1946; at one time examining physician for a local draft board; for many years affiliated with the Paterson (N. J.) General Hospital, where he served as president of the medical board; died May 29, aged 48, of heart disease.

George Loring Tobey Jr.,⊕ Boston; born in Lancaster, Mass., June 3, 1881; Harvard Medical School, Boston, 1903; specialist certified by the American Board of Otolaryngology; member of the American Academy of Ophthalmology and Otolaryngology and formerly vice president; member, past president and vice president of the American Otological Society; member of the American Laryngological Association, American Laryngological, Rhinological and Otological Society and the New England Otological and Laryngological Association; fellow of the American College of Surgeons; served during World War I; consulting surgeon at the Massachusetts Eye and Ear Infirmary; died May 20, aged 65, of valvular heart disease.

Franklin Harold Crail ⊕ Las Vegas, N. M.; born on June 28, 1880; Northwestern University Medical School, Chicago, 1907; fellow of the American College of Surgeons; past president of the New Mexico Medical Society; for many years president of the board of education; served during World War I and on the medical examining selective service board during World War II; founder and first president of the Rotary Club; at one time superintendent of the New Mexico State Hospital; on the staffs of the Las Vegas and St. Anthony's hospitals; died in Forrest City, Ark., May 22, aged 66, of coronary heart disease.

John Darrington ⊕ Yazoo City, Miss.; born in Wilkinson County, March 6, 1870; Medical Department of Tulane University of Louisiana, New Orleans, 1892; member of the House of Delegates of the American Medical Association in 1906 and 1907; past president of the Mississippi State Medical Association, Yazoo County Medical Society, Tri-State Medical Association, Central Medical Society and the Southeastern Surgical Congress; member of the state board of health from 1907 to 1915 and again from 1929 to 1935; affiliated with the King's Daughters Hospital; died May 19, aged 76.

Peter Felix Carlucci ⊕ Detroit; University of Pennsylvania Department of Medicine, Philadelphia, 1907; affiliated with St. Mary's Hospital; resident physician, Tuller Hotel; died May 14, aged 64, of heart disease.

William Warren Cowgill, Shaker Heights, Ohio; University of Pennsylvania Department of Medicine, Philadelphia, 1904; died June 6, aged 67, of cerebral hemorrhage.

William Edward Durr, Glencoe, Ohio; Ohio Medical University, Columbus, 1905; member of the American Medical Association; died in the Ohio Valley General Hospital in Wheeling, W. Va., May 16, aged 70, of chronic glomerulonephritis.

Lionel Sinclair Luton ⊕ St. Louis; Rush Medical College, Chicago, 1901; fellow of the American College of Physicians; served during World War I; died May 16, aged 71, of coronary thrombosis.

Bernard John Meirink, Germantown, Ill.; Washington University School of Medicine, St. Louis, 1899; for many years mayor; served on the staff of St. Joseph Hospital in Breese; died in Manchester, Mo., May 13, aged 74, of cerebral hemorrhage and hypertension.

Harry J. Newell ⊕ Alexandria, Neb.; John A. Creighton Medical College, Omaha, 1903; on the staff of the York (Neb.) General Hospital, where he died May 4, aged 75, of carcinoma of the liver.

William Thurston Patch, Boston; University of the City of New York Medical Department, New York, 1890; member of the American Medical Association; died recently, aged 86, of bronchopneumonia.

Richard Reeser ⊕ Columbia, Pa.; Jefferson Medical College of Philadelphia, 1896; past president of the Lancaster County Medical Society; served during World War I; on the staff of the Columbia Hospital; died May 30, aged 72, of coronary thrombosis.

Frank Rose, Spokane, Wash.; University of Minnesota College of Medicine and Surgery, Minneapolis, 1901; member of the American Medical Association; served during World War I; died in the Veterans Administration Facility in American Lake April 4, aged 77, of bronchopneumonia.

Morton Maxwell Small, Waterville, Maine; Medical School of Maine, Portland, 1901; member of the American Medical Association; died April 23, aged 67 of uremia, cerebral hemorrhage and nephritis.

Clarence Nelson Smith, Glen Elder, Kan.; Kansas City (Mo.) Medical College, 1905; died April 9, aged 73, of diabetes mellitus.

Vere Treichler ⊕ Elizabethtown, Pa.; Jefferson Medical College of Philadelphia, 1905; affiliated with the Philadelphia Freemasons' Memorial Hospital, where he died April 28, aged 67, of angina pectoris.

John Edward Welsh, Brimfield, Ill.; St. Louis University School of Medicine, 1920; member of the American Medical Association; served during World War I; examining physician for the county draft board during World War II; died in St. Francis Hospital in Peoria May 4, aged 64, of thyrotoxicosis.

Herbert Carlton Woods, Tama, Iowa; the Hahnemann Medical College and Hospital, Chicago, 1894; member of the American Medical Association; died in the Deaconess Hospital, Marshalltown, April 5, aged 77, of prostatic hypertrophy.

The New Medical Code

For some time the Order of Doctors has been preparing a code of Deontology, which has lately been modified by the Council of State, approved by the government and published in the *Journal officiel.* The code contains seventy-nine articles concerning the practice of medicine and the relations of doctors one with another.

General Duties of Doctors

The code emphasizes the four principles, which are, by tradition, those of French medicine: (1) free choice of the doctor by the patient, (2) liberty of prescription by the doctor, (3) direct agreement of the doctors and the patients as regards fees and (4) direct payment of the fees by the patient to the doctor. These principles are imperative for every doctor save when their observance is incompatible with legal rules. All publicity and personal propaganda of a commercial character are forbidden to doctors, also all payments or acceptance of monies between practitioners and all commissions whatever and all jobbery between doctors, pharmacists, medical auxiliaries or any other person. It forbids doctors any outside activity incompatible with the professional dignity and also the use of a political mandate or of an administrative function for professional ends to increase the number of their clients. The doctor must not meddle with family affairs.

Duties to Patients

In case of public danger, a doctor shall not leave his patients save by formal written order from competent authorities. The code emphasizes that, even when he is alleviating suffering, the primordial care of the doctor must be the preservation of human life. Except for emergencies, a doctor retains always the right to refuse his attendance on personal or professional grounds. While refusing to continue in attendance, the doctor must enforce the respect for the rules of hygiene and prophylaxis.

A special article deals with therapeutic abortion, which can be done when the life of the mother is in serious danger. In such cases the doctor must abide by the prescriptions of article 87 of the Decree of the 29th of July 1939, which prescribes the examination of the expectant mother by three doctors, who must draw up a statement giving the reasons for the abortion and address it by registered post to the president of the district council of the region to which they belong. By another article the doctor is prohibited from reducing his fees in order to compete with his colleagues, but each doctor can give gratuitous attendance whenever his conscience prompts him to do so. It is forbidden to make a contract providing for a lump sum taking into consideration the duration or the efficiency of a treatment, except in the case of childbirth, surgical operation or physical therapy. The acceptance, the solicitation or the offer of a share of his fees, even if it does not materialize, constitutes a serious professional dereliction.

Duties Concerning Social Medicine

In several of its articles the code emphasizes the duty for doctors to give their full help to the services of social medicine and to collaborate in the work of the public authorities. The code also provides that the practice of medicine in the service of an enterprise, a collectivity or a private institution must be the subject of a written contract, which must be previously submitted to the departmental council of the order; doctors under a status established by the public authority are not subject to these dispositions. The doctor working in the preventive medicine service must refer all persons recognized as ill to practitioners. Except in urgent cases, doctors are forbidden to be at the same time the controlling and the treating doctor. Controlling doctors must not interfere with the treatment; in case of disagreement with the treating doctor, they must advise the latter personally.

Fraternal Duty

The code provides that, in the event of professional dissension between two colleagues and the impossibility of reconciliation, the president of the district council of the order is to be advised. In principle, a doctor must have only one office. Doctors are forbidden to have a colleague running another office for their account. As from the 1st of January 1951, a doctor must not establish himself in a building in which one of his practicing colleagues is located without the latter's agreement or, failing this, without the authorization of the district council of the order, except for specialists practicing different specialties.

All doctors, being members of the order, are subject to the code of deontology. They must assert that they have studied it and that they pledge themselves under oath and in writing to abide by it. Infractions of the code come under the disciplinary jurisdiction of the order. Similar codes are being prepared for dentists, chemists and midwives.

Bacteriostasis and Bacteriolysis of Mycobacterium Tuberculosis by Clitocybine B

A new antibiotic, clitocybine B, discovered by Professor Charles Hollande of the Montpellier Faculty of Pharmacy, has already been mentioned in the Paris letter. At a recent meeting of the Academy of Sciences in Paris Hollande presented his latest research on clitocybine. It is clitocybine B which has this action on the bacillus of tuberculosis. Hollande has been able to grow it in special culture mediums and under particular conditions; the other mycelia and cacophores, though exerting action on staphylococci, streptococci and meningococci, do not contain clitocybine B. As a bacterial test, the author has employed human bacilli of tuberculosis and has seen in vitro the bacteriostatic and bacteriolytic effects of clitocybine B. Guinea pigs inoculated with an emulsion of Mycobacterium tuberculosis, which emulsion had been in contact during twenty-four hours with clitocybine B, presented no organs or glands attacked two months and a half afterward at the necropsy, whereas test guinea pigs, inoculated at the same period, presented infected organs and caseous glands. Purified clitocybine B is not toxic for guinea pigs.

Miscellaneous

According to a communication of Charles Picard to the Académie des Inscriptions et Belles Lettres, a monument to Hippocrates has lately been discovered at Ostia, Italy. It is a new picture of Hippocrates representing a personage of entirely different aspect from any known up to now. The monument proves that this learned man was already known in Athens.

Professor Jacques Tréfouel, director of the Paris Pasteur Institute, has been elected a member of the Academy of Sciences.

Correspondence

EOSINOPHILIC GRANULOMA OF BONE

To the Editor:—The readers of the editorial comment "Eosinophilic Granuloma of Bone" (THE JOURNAL, April 26, p. 1284) may become confused on the issue of whether "eosinophilic granuloma of the bone" is a newly discovered disease entity or whether it is the monosymptomatic form of a systemic disorder formerly described under different designations as "Schüller-Christian's disease" by Rowland in 1928, or "lipid granulomatosis" by Chester in 1930 and by Fraser in 1934 and as "essential xanthomatosis of the normocholesteremic type" by Thannhauser and Magendantz in 1937 A similar comment has been made by Albert Weinstein, H. C. Francis and B. F. Sprofkin (Eosinophilic Granuloma of Bone, *Arch. Int. Med.* **79:** 176 [Feb.] 1947).

A. Schüller (Ueber eigenartiger Schadeldefekte im Jundalter, *Fortschr. a. d. Geb. d. Röntgenstrahlen* **23:**12, 1915-1916) described "peculiar defects of the membraneous bones of the skull," referring later (Ueber ein eigenartiges Syndrom von Dyspituitarismus, *Wien. med. Wchnschr.* **71:**510, 1921) to "a peculiar syndrome of dyspituitarism" H A. Christian (Defects in Membranous Bones, Exophthalmos and Diabetes Insipidus, in Contributions to Medical and Biological Research **1:**390, New York, Paul B. Hoeber, 1919; *M. Clin North America* **3:**849 [Jan.] 1920) called attention to a clinical syndrome consisting of defects in membraneous bones, exophthalmos and diabetes insipidus." A. Hand (Polyuria and Tuberculosis, *Arch. Pediat.* **10:**673, 1893) had already observed a case which belonged in this group in 1893 but classified his observation as "polyuria and tuberculosis." After the syndrome had been clinically established, the pathologist R. S. Rowland (Xanthomatosis and the Reticulo-endothelial System, *Arch. Int. Med* **42:**611 [Nov.] 1928; *Ann. Int. Med.* **2:**1277 [June] 1929) demonstrated that the histologic lesions characteristic of Schuller-Christian's syndrome consist of reticulum cells and histiocytes, cholesterol-containing "foam cells" and elements of acute inflammation like eosinophils, round cells and polynuclear elements. Rowland considered the development of "foam cells" as characteristic of the lesion as had been previously suggested by the dermatologists F. D. Weidman and Walter Freeman (Xanthoma Tuberosum, *Arch. Dermat. & Syph.* **9:**149 [Feb] 1924) on the basis of two autopsies of cases with lesions of the skin, central nervous system and other organs. In his pioneer work on the histology of Schuller-Christian's syndrome Rowland had already described the occasional involvement of the lung and supplemented the description of the pathologic changes in the lung with characteristic x-ray pictures, as others did later Chester (Ueber Lipoidgranulomatose, *Virchows Arch f. path. Anat.* **279:**561, 1930) demonstrated the granulomatous nature of the lesions and classified the disease as "lipid granuloma" The most complete histologic description of solitary bone lesions, supported by excellent photomicrographs in color, are found in the paper "Skeletal Lipoid Granulomatosis", by J. Fraser in 1934-1935. Fraser (Lipoid Granulomatosis of the Bones, *Brit. J. Surg.* **22:**800 [April] 1935) had already called attention to the endothelial proliferation, the accumulation of eosinophilic cells and the presence of giant cells in the earlier stages of the lesion in "lipoid granuloma." S. J. Thannhauser and Heinz Magendantz (The Different Clinical Groups of Xanthomatous Diseases, *Ann. Int. Med.* **11:**1662 [March] 1938. Thannhauser, S. J.: Lipidoses, Oxford University Press, 1940) demonstrated, on the basis of numerous clinical observations of cases of xanthomatous diseases of heterogeneous etiologies, that the cases of Schuller-Christian's syndrome and those of generalized lipoid granulomatosis showed normal cholesterol content of the serum in contrast to other groups of xanthomatous disease with hypercholesteremia. For this reason they used the name "essential xanthomatosis of the normocholesteremic type" for Schüller-Christian's syndrome and the generalized form of "lipoid granulomatosis." The cholesterol content of the tissues of this disorder in its xanthomatous phase is ten to twenty times higher than in normal tissues, while the cholesterol level of the serum remains normal. These authors, therefore, contended that the cholesterol accumulation in the xanthomatous cells in this disorder is not the result of cholesterol infiltration from the blood stream but is caused by new formation of cholesterol within those cells which gradually develop into xanthoma cells ("foam cells"). Thannhauser and Magendantz showed in their clinical material and in the cases reported in the literature that various organs (skin, "disseminata" type of xanthoma, osseous system, dura, brain, lung, pleura, liver, spleen and lymph nodes) may be involved singly or in various combinations in the systemic disease under discussion.

Louis Lichtenstein and H. L. Jaffe reported in a histologic study cases of solitary bone lesions which they designated as "eosinophilic granuloma of bones" (*Am. J. Path.* **16:**595 [Sept.] 1940). They apparently believed at this time that this type of solitary bone granuloma was a disease not before described. They were apparently not familiar with the exhaustive histologic description by J. Fraser in 1934 of several such cases ("skeletal lipoid granulomatosis") or with case 20 published in the article "Different Clinical Groups of Xanthomatous Diseases" by Thannhauser and Magendantz.

It was not until the studies of Sidney Farber and his co-workers (Eosinophilic or Solitary Granuloma of Bone, *J. Bone & Joint Surg.* **24:**499 [July] 1942; Eosinophilic Granuloma of Bone; Schuller-Christian's Disease, *Acta. med. Scandinav.* **118:** 292, 1944) (The Nature of "Solitary Eosinophilic Granuloma" of Bone, *Am. J. Path.* **17:**625 [July] 1941; The Nature of Some Diseases Ascribed to Disorders of Lipid Metabolism, *Am. J. Dis. Child.* **69:**350 [Nov.] 1944) and of J. E. Holm, G. Teilum and E. Christensen that the designation "eosinophilic granuloma" was applied not only to solitary bone lesions but also to those of "Schuller-Christian's syndrome" as well as to the generalized lesions in other organs of the group formerly classified as "lipoid granulomatosis" or clinically designated as "essential xanthomatosis of the normocholesteremic type." Through the microscopic studies of Teilum and his co-workers it was demonstrated that the natural history of such an "eosinophilic granuloma" comprised the following phases:

1. A proliferative phase in which histiocytic proliferation associated with accumulation of eosinophilic leukocytes is observed (See also Fraser.) In this phase there is no evidence of "foam cells"
2. A granulomatous phase with increase of blood vessels and fibrils, reticular cells and histiocytes, eosinophils and giant cells ('Touton cells') and incipient lipoid phagocytosis
3. A xanthomatous phase with nests and isolated foam cells.
4. A fibrous stage considered as a healing phase.

These four phases often show no strict demarcation during the course of the disease, and the histologic features of these four stages may overlap considerably during the course of the disease. It is evident from the microscopic studies of Teilum as well as of Farber that solitary "eosinophilic granuloma" is the monosymptomatic early stage of a systemic disease designated by Chester as well as by Fraser as "lipoid granulomatosis," by R. S. Rowland as "Schuller-Christian's syndrome" and by Thannhauser and Magendantz from the clinical point of view as "essential xanthomatosis of the normocholesteremic type."

The paper of Jaffe and Lichtenstein has caused considerable misunderstanding about the classification of the disease under discussion, as is seen in recent publications and in your editorial comment. The earlier authors as well as Lichtenstein and Jaffe refer to the same disease. The designation of the disease under discussion as "eosinophilic granuloma" is incomplete and therefore misleading, since "eosinophilic granuloma" is not a disease entity but only a phase in the histologic aspect of a distinct clinical syndrome. The xanthoma cell formation in the later phases of the lesions is as characteristic of the disease as the reticulohistiocytic proliferation and the accumulation of eosinophils in its earlier phases. If one does not prefer to use the older names "Schüller-Christian's syndrome" or "lipoid granulomatosis" or "normocholesteremic xanthomatosis" one should think of a classification which at least refers to the principal two histologic phases of the granuloma, namely the proliferative and eosinophilic phase and the xanthomatous phase. The designation of the localized and systemic disorder as "eosinophilic xanthomatous granuloma" seems to be more appropriate even if it does not embrace the reticulohistiocytic proliferation of the early lesion. Such a name would also prevent further misunderstanding in the conception and classification of this disorder.

So-called eosinophilic granuloma of bone is certainly not a newly discovered disease entity but is the monosymptomatic form of a well known systemic granulomatous disorder in which histiocytes, eosinophils and xanthoma cells are observed in the lesion at different phases.

S. J. Thannhauser, M.D.,
Joseph H. Pratt Diagnostic Hospital,
Boston.

Medical Motion Pictures

FILM REVIEWS

NEW MOTION PICTURE ADDED TO A. M. A. FILM LIBRARY

The Medical Motion Picture—Its Development and Present Application. 16 mm., color, sound, 1,100 feet (one reel). Showing time thirty minutes. Produced for the American Medical Association in 1947 by Audio Productions, Inc., New York. Technical adviser Ralph P. Creer. Procurable on loan from Committee on Medical Motion Pictures, American Medical Association, Chicago 10.

Consisting of excerpts from several films made prior to and during World War I, this motion picture was prepared especially for the Centennial Session of the American Medical Association held in June in Atlantic City. Included are the first surgical motion picture made on 16 mm. film and modern technics such as animation, microcinematography, endoscopic photography and moving x-rays. The final sequence provides a look into the production of good teaching films. This sequence is illustrated by a case of cancer of the thyroid with metastasis to the thigh, which was treated with radioactive iodine. The use of the Geiger counter is demonstrated.

A detailed review will be published in a subsequent issue of The Journal.

The Air We Breathe. 16 mm., black and white, sound, 1,100 feet (one reel). Showing time thirty minutes. Produced in 1945 by Wilding Pictures, Inc. Procurable on loan from Mine Safety Appliances Company, Braddock, Thomas and Meade streets, Pittsburgh 8.

This film briefly illustrates the history of the search for a safe and satisfactory industrial breathing mask. As the film progresses, a central teaching theme is developed in which it is stressed that the air we breathe must be as safe as the food we eat. Dusts, fumes, gases and mists are illustrated in a clear and simple manner. The film then takes one into the long sustained effort put forth by the Mine Safety Appliances Company to develop an industrial breathing mask worthy of official approval by the United States Bureau of Mines. "Dustofol" is shown undergoing the various severe tests which the Bureau of Mines makes prior to granting an approval. Masks of different types constructed for specific purposes are illustrated, as are proper methods of applying, wearing, cleaning and maintenance.

This film may be classified as teaching in character, with a minimum of commercialism. It will probably be best received by groups of foremen, safety classes and shop safety councils. The photography is excellent.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Medical Service Corporations: Liability, as Insurer, for Services of Special Nurse.—The plaintiffs sued to recover from the defendant King County Medical Service Corporation for a special nurse's services rendered during the hospitalization of the plaintiff wife in the defendant Seattle General Hospital and for other relief. The defendant hospital filed a cross complaint for the amount of the hospital bill. From judgments in favor of the plaintiffs, the defendants appealed to the Supreme Court of Washington.

At approximately 7:30 a. m. on the date of the accident the plaintiff wife, an elevator operator in the Chamber of Commerce Building at Seattle, entered that building with her husband, who was employed as its building superintendent, preparatory to commencing her work. Her husband was to take her in the elevator to the third floor, where she was to prepare for work and take over the operation of the elevator at 7:45 a. m. In the morning darkness, her husband opened the door of the elevator shaft. The elevator car was not at the lobby level, but the plaintiff wife, believing it to be there, stepped through the door and fell about 6 feet to the bottom of the shaft, sustaining the injuries which form the basis of the controversy herein.

For some time prior to the date of the accident the Seattle Chamber of Commerce had been a party to a contract with the defendant, King County Medical Service Corporation, which had previously entered into a separate contract with the Seattle General Hospital. This contract set forth that the Service Corporation had arranged with certain hospitals to furnish necessary hospital and nursing services to employees of the Chamber of Commerce. The employees were to pay a certain sum of money each month to the Service Corporation, which would in turn pay to any hospital furnishing services the amount of the bill. Among other things, the contract provided:

> 8. The medical director of the company, who is hereinafter referred to as the "medical director," or any physician whom he may designate, shall have the exclusive and absolute right to determine whether any patient is entitled to treatment, and if so, to what treatment, and any such determination made in good faith shall be deemed and held to be conclusive and binding upon the company, the patient, his heirs, executors, administrators and dependents and upon the employer if the employer be interested, and upon those offering said services. . . .

The hospitals cooperating with the plan agreed to "furnish to the patients described in the attached agreement such hospital and nursing services as may be reasonably required and authorized by the medical director of the company in the treatment of any injury or sickness which is covered by the service of the members of the King County Medical Service Bureau under the attached agreement." It was also agreed that the monies collected by the company together with certain payments to be made by patients "shall, in so far as the patients are concerned, be in full compensation of the services which are hereby offered by such hospitals and that when such sums are paid to the company the hospitals shall be bound to render to such individuals, groups or employees the services herein enumerated and that, in the event of the failure of the Company to pay said sums to the hospitals, then the hospitals shall look only to the Company for said sums and that the receipts of the Company to such individuals, groups or employees shall be binding upon the hospitals."

Medical treatment for the plaintiff wife's injuries was rendered by Dr. Smith, and hospitalization was furnished by the defendant Seattle General Hospital. Special nurses were employed by the plaintiffs. Dr. Smith at first assumed that the plaintiff wife was covered by the workmen's compensation act but later was notified by the Department of Labor and Industry that she did not come within its terms. Dr. Smith then assumed, from information given to him by the plaintiff wife and her husband, that she was covered by the Service Corporation contract but, at some time during the period of his treatment, was orally informed by the medical director for the Service Corporation that the Service Corporation had refused to assume liability for the plaintiff's bills. Dr. Smith, however, continued to treat her.

The defendant first contended that the plaintiff's action could not prevail because of the finding of Dr. Ostrom, medical director for the Service Corporation, that she had been injured while in the course of her employment. It was the defendant's claim that the Service Corporation's medical director had unrestricted authority under paragraph 8 of the medical aid contract to determine whether or not a member employee comes within its terms so as to be entitled to medical and hospital services. We believe, said the court, that the medical director of the Service Corporation had no authority to determine whether or not plaintiff's injuries were sustained in the course of her employment. This is a legal question which often presents serious difficulties. Considerable judicial opinion and editorial subject matter has been written in an effort to lay down an understandable rule determining whether one is or is not "injured in the course of employment." The Supreme Court then held that plaintiff's injuries were not sustained while she was in the course of her employment as an elevator operator but while she was an invitee entering the building preparatory to commencing her employment as an elevator operator and that the defendant's medical director was in error in refusing to certify her as one entitled to physician, nurse and hospital care

The Service Corporation next contended that liability could not attach to it for the reason that it was merely an agent of the several contracting parties and beneficiaries and not an insurer or guarantor of performance of the contract. The court said that the authority reserved to the Service Corporation was to make final decisions. This made the Service Corporation, not an agent of, but a co-principal with, the physicians, hospitals and employers, as contracting parties with the employee. The predominant purpose of the Service Corporation, as evidenced by paragraph 8 of its contract with the employers, said the court, is to control the business which its contract promotes and provides for, namely, the rendering of service to members and the collection of fees or premiums from such members in consideration therefor. The Service Corporation alone, of all the parties to the agreement, has the highest degree of exclusive control and authority over the business contemplated by the terms of the respective agreements When a person styling himself as an agent is named contracting party and reserves to himself the exclusive and binding authority to decide all questions presented by the contract, and when the exercise of such authority is, by express provision, made binding upon all parties to the contract, then, certainly, he is not an agent but is, in fact and in law, the principal and the *moving spirit in control* of every phase of the business contemplated by the contract. Continuing, the court said, there is no evidence of intention to delegate authority or control to the Service Corporation, either from the Seattle Chamber of Commerce in the standard group medical contract or from the Seattle General Hospital in the Hospital Service agreement. On the contrary, control, power and authority to conduct the business of the parties is expressly reserved and vested in the Service Corporation. Title to all money collected is expressly reserved in the Service Corporation as trustee. The defendant Service Corporation, under the terms of its own contract, is, of necessity, a principal. It derives no authority from any one. It is the fountainhead and primary source of authority. It is the trustee of the money collected by it. While it styles itself a charitable corporation, there is no reference to be found in any of the contracts relating to the disposition of any profits left in its hands over and above the disbursements made to physicians, hospitals and nurses. It should be noted that the Service Corporation, under the terms of its contract with the employer, collects all the money which is involved in the transactions covered by the contracts. It makes all remittances to the physicians, hospitals and nurses for the services furnished, at its instance, to employee members. The contract vests title to these funds in the Service Corporation. The court therefore concluded that the Service Corporation was a primary contracting party to each of the agreements under consideration and directly liable for violation of its contract by refusing, through its medical director, to accept and certify the plaintiff for all the benefits and services accruing to her under the contracts, as an employee-member of the medical aid groups.

Furthermore, the court held that the business being conducted by the Service Corporation meets the requirements of the insurance statute and that the corporation performs the functions of an insurer. It sells medical protection to working people against the hazard of injury or illness. It releases the employer from the care and expense of medical and health aid to its employees. It collects a fixed premium from each employee and reduces the respective rights and obligations of all the interested parties to a written contract. Through its medical director it determines when coverage applies to the employee—when it does not apply. All of this brings the business of the Service Corporation within the spirit and purpose of the insurance statutes.

Accordingly the court held that the plaintiff, as an employee member of the medical aid group, was entitled to hospitalization, nurse and physician care; that the King County Medical Service Corporation and the Seattle General Hospital are co-principals of the contract entered into between them and the Seattle Chamber of Commerce and that the Service Corporation is a trustee of the monies collected by it; that they are jointly and separately liable for the expense of the service administered to plaintiff; that the judgment against the Service Corporation and in favor of the plaintiff and his wife for the sums paid for nurses expense and the judgment denying the Seattle General Hospital recovery of the amount of its bill for hospital care incurred by the plaintiff were both proper. Accordingly the judgments of the lower court in favor of the plaintiff were affirmed.—*McCarty v. King County Medical Service Corporation, 175 P. (2d) 653 (Wash., 1946).*

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

BOARDS OF MEDICAL EXAMINERS
BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of the boards of medical examiners and boards of examiners in the basic sciences were published in The Journal Aug. 9, page 1262.

NATIONAL BOARD OF MEDICAL EXAMINERS

National Board of Medical Examiners: *Parts I and II.* Various centers, Sept. 15-17. *Part III.* Durham, N. C., Oct. 21-23. Exec. Sec., Mr. Everett S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

American Board of Anesthesiology: Part II. *Oral.* Cleveland, Oct. 5-11. Sec., Dr. P. M. Wood, 745 Fifth Ave., New York 22.

American Board of Dermatology and Syphilology: *Part II. Written.* Various centers, Sept. 15. Sec., Dr. G. M. Lewis, 66 E. 66th St., New York 21.

American Board of Internal Medicine: *Oral.* Chicago, Oct. 8-10. Asst. Sec., Dr. W. A. Werrell, 1 West Main St., Madison 3.

American Board of Neurological Surgery: *Oral.* Chicago, May or June. Final date for filing application is Feb. 1. Sec., Dr. W. J. German, 310 Cedar St., New Haven, Conn.

American Board of Obstetrics and Gynecology: *Part I. Written.* Various Centers, Feb. 6. Final date for filing application is Nov. 1. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh 6.

American Board of Ophthalmology: Chicago, October 6-12. Sec., Dr. S. Judd Beach, 704 Congress St., Portland, Me.

American Board of Orthopaedic Surgery: Part II. Chicago, Jan. 22-23. Final date for filing applications is Sept. 15. Sec., Dr. F. M. McKeever, 1136 W. Sixth St., Los Angeles 14.

American Board of Otolaryngology: Chicago, Oct. 7-11. Sec., Dr. D. M. Lierle, University Hospitals, Iowa City.

American Board of Pathology: Chicago, Oct. 24-25. Final date for filing application is Sept. 15. Sec., Dr. Robert A. Moore, Euclid Ave. and Kingshighway, St. Louis 10.

American Board of Pediatrics: Dallas, Dec. 5-7. Philadelphia, Jan. 9-11. Sec., Dr. Lee F. Hill, 718 Royal Union Bldg., Des Moines 9.

American Board of Plastic Surgery: Examinations are given in April and November of each year in the home town of applicants. Sec., Dr. Louis T. Byars, 508 N. Grand Blvd., St. Louis.

American Board of Psychiatry and Neurology: *Oral.* New York, December. Final date for filing application is Sept. 15. Sec., Dr. Francis J. Braceland, 102-110 Second Ave., S. W., Rochester, Minn.

American Board of Surgery: *Written.* Various Centers, March. Final date for filing application is Dec. 1. Sec., Dr. J. S. Rodman, 225 S. 15th St., Philadelphia 2.

American Board of Urology: Chicago, *February.* Final date for filing application is Nov. 1. Sec., Dr. Harry Culver, 1409 Willow St., Minneapolis 4.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Journal of Diseases of Children, Chicago

73:391-530 (April) 1947

*Postacidotic State of Infantile Diarrhea: Symptoms and Chemical Data. Postacidotic Hypocalcemia and Associated Decreases in Levels of Potassium, Phosphorus and Phosphatase in the Plasma. S. Rapoport, K. Dodd, M. Clark and I. Syllm.—p. 391.
Feeding of Premature Infants: Comparison of Human and Cow's Milk. H. H. Gordon, S. Z. Levine and Helen McNamara.—p. 442.
Erythema Infectiosum. M. J. Fox and J. M. Clark.—p. 453.
Juvenile Osteopetrosis: Metabolic Studies in 2 Cases and Further Observations on Composition of the Bones in This Disease. J. B. Pincus, I. F. Gittleman and B. Kramer.—p. 458.
Effect on Organisms of Children of Privations Caused by the Siege of Budapest. J. Bakucz.—p. 489.

Postacidotic State of Infantile Diarrhea.—Rapoport and his associates found in infants with diarrhea, in the period following cessation of acidosis and dehydration, low levels of calcium, potassium, phosphorus and phosphatase. The reduction of the ions is thought to be caused by their avid uptake by the previously depleted tissues of the body. The postacidotic phase of diarrhea is characterized by a clinical picture consisting of lethargy or irritability, convulsions, respiratory embarrassment, derangements of cardiac function, intracranial and gastrointestinal hemorrhages and generalized edema. Less often classic signs of peripheral tetany and of carpopedal and laryngeal spasms are seen. The clinical manifestations appear related primarily to the hypocalcemia, although possible effects of low values of potassium and phosphorus in the plasma cannot be gainsaid. Prematurity, malnutrition, severe diarrhea and acidosis of long duration, considerable fever, extensive dehydration and retention of waste nitrogen favor the occurrence of severe degrees of postacidotic manifestations and hypocalcemia. Correction of the acidosis by alkalizing agents may accentuate the tendency to the postacidotic disturbance. Calcium salts have been of benefit in preventing or curing the postacidotic phase of diarrhea.

Dextrocardia with Complete Situs Inversus: Case Reports. S. Richman.—p. 616.
Fracture of a Sesamoid Bone of the Thumb: Report of a Case. D. L. Jellinger.—p. 619.

Disseminated Granuloma Inguinale of Bones.—A Negro woman aged 33 who had a foul bloody vaginal discharge gave a history of having had a supravaginal hysterectomy, bilateral salpingo-oophorectomy and appendectomy. The cervical stump of the uterus was almost completely destroyed by a soft ulcerating bleeding growth. Two biopsies of the vaginal wall revealed vascular granulative tissue but the underlying specific lesion of granuloma inguinale was not recognized. A nonfunctioning kidney was removed and a psoas abscess was drained. Later a third biopsy of the vaginal lesion revealed the characteristic specific granulomatous tissue consisting of many vacuolated macrophages filled with Donovan bodies, associated with scattered collections of polymorphonuclear cells. A careful review of previous vaginal and cervical biopsies disclosed occasional macrophages with Donovan bodies. Subsequently multiple bone lesions developed and the patient died. The results of the necropsy are described by Rhinehart and Bauer. Disseminated granuloma inguinale of bones is an uncommon condition characterized roentgenologically by osteolytic areas in the bones. In none of the cases so far reported are the x-ray changes specific for this disease. Diagnosis is best established by biopsy with search for macrophages containing Donovan bodies.

Theoretical Considerations in Venereal Disease Control Planning. M. Leider.—p. 325.

Streptomycin Treatment of Gonorrhea.—Chinn and his associates gave each of 4 men with acute gonorrheal urethritis 0.1 Gm. of streptomycin sulfate dissolved in 3 cc. of isotonic solution of sodium chloride at hourly intervals for five doses. All were observed daily for three days after treatment and at the seventh and tenth days. All 4 responded promptly within twenty-four to forty-eight hours by a reduction or cessation of the urethral discharge. Cultures following prostatic massage at each examination were found negative. Later treatment with a single dose of 0.5 Gm. of streptomycin was attempted, and consistent cures could be obtained in this way. Single doses of 0.4 and 0.3 Gm. likewise proved effective in all of the cases, but smaller doses (0.2 or 0.1 Gm.) were not always effective. Patients failing to respond to streptomycin were cured with a second treatment of 0.2 Gm. of streptomycin or with penicillin.

Subcutaneous Injections of Penicillin in Beeswax-Peanut Oil in Gonococcic Urethritis.—Frost and his associates administered a single subcutaneous injection of 300,000 units of penicillin in beeswax-peanut oil to 200 patients with acute gonococcic urethritis; 177 (88.5 per cent) of these were cured, and 23 (11.5 per cent) were failures. . These results compare favorably with those obtained when penicillin-beeswax mixtures were administered by the intramuscular route. There was less discomfort at the time of injection with the subcutaneous than with the intramuscular route, but in a small percentage of cases in which the material was injected too superficially subcutaneous injections were followed by indurations, nodules and sterile abscesses. The detection of 11 of the 23 failures three weeks after treatment emphasizes the necessity of a minimum follow-up period, both clinical and bacteriologic, of at least twenty-one days. Single subcutaneous or intramuscular injections of 300,000 units of penicillin-beeswax-peanut oil 1 cc. constitutes the simplest and most satisfactory method of treating acute gonococcic urethritis available at present.

Analysis of Pelvic Operations Preceding Hysterectomy: Causal Relationship. C. Tyrone.—p. 669.

Surgical Treatment of Carcinoma of the Lung.—Rienhoff records the clinical analysis, preoperative preparation, operative procedure and the immediate and remote postoperative results in a series of 327 consecutive cases of carcinoma of the lung which have been referred for surgical treatment. Chest roentgenograms were always positive. The presence of bronchogenic cancer should be inferred in every instance in which roentgenograms of the chest show a departure from normal and in which this departure is not characteristic of one of the commoner lesions of the lung. An infiltrating hilar shadow in a patient past middle age, associated with cough, hemoptysis and absence of tubercle bacilli in the sputum almost certainly indicates a bronchogenic carcinoma. Second to the roentgenogram in diagnostic importance is bronchoscopy. A positive diagnosis of primary carcinoma of the lung can be made by direct vision, by biopsy or by both. In 70 per cent of the patients in this series a positive biopsy of the cancer was obtained. Exploratory thoracotomy should be resorted to far more frequently than it has been in the past. In 70 per cent of the 112 patients in whom a total pneumonectomy was performed there were metastases to the bronchial and tracheal lymph nodes. This fact emphasizes the necessity of performing a total pneumonectomy with dissection of the regional nodes in order to effect a permanent cure. Treatment with penicillin and the induction of artificial pneumothorax is stressed in the preoperative treatment. Primary carcinoma of the lung can be satisfactorily treated by surgical removal of the entire organ. Surgical measures short of total pneumonectomy are not efficacious. Postoperative mortality and longevity are at least as good as, if not better than, the postoperative results following the surgical treatment of carcinoma of other organs.

Thiouracil, Thiobarbital and Propyl Thiouracil in Hyperthyroidism.—Lahey and Bartels say that experience with the use of thiouracil, thiobarbital and propyl thiouracil in 660 cases of hyperthyroidism during the last three and one-half years has shown that these drugs act by preventing the synthesis of an active thyroid hormone and by so doing lead to an increase in hyperplasia of the thyroid gland. If these drugs are used in adequate doses over a sufficient length of time they will restore the basal metabolic rate to a normal level. The comparative dose of thiouracil, thiobarbital and propyl thiouracil is 600 mg., 50 mg. and 200 mg. respectively. Since the percentage of reactions is 9 for thiouracil, 28 for thiobarbital and 2 for propyl thiouracil, the last named agent is the drug of choice. Since propyl thiouracil may cause depressive changes in the white blood cells, its administration must be followed with white and differential blood counts made every ten to fourteen days during treatment. The treatment of agranulocytosis consists in the early administration, intramuscularly and by nasal and throat spray, of adequate doses of penicillin. The increase in the vascularity of the thyroid caused by these drugs makes thyroidectomy difficult, but the simultaneous use of iodine largely overcomes this difficulty. These antithyroid drugs produce prolonged remissions of mild primary hyperthyroidism, but little hope can be held for a permanent remission in patients with severe primary hyperthyroidism with a large gland. Since the mortality of thyroidectomy is now almost nil, surgical removal after proper preoperative treatment seems to be the treatment of choice for hyperthyroidism.

Pediatric Endocrinology. G. A. Campbell and P. J. Maloney.—p. 533.

Influenzal Meningitis.—According to Little, influenzal meningitis is confined almost entirely to infancy and early childhood. Twelve of the group of 13 patients reviewed in this paper were less than 4 years old. Best results in the treatment of meningitis due to Hemophilus influenzae are obtained by the use of one of the sulfonamides with type specific antiserum. With this treatment the fatality rate has been lowered from 95 to 50 per cent and less. Every patient should be given both sulfonamide therapy and serotherapy as soon as a diagnosis has been made.

Complications of Infectious Mononucleosis.—According to Brien infectious mononucleosis ordinarily is not difficult to recognize, and complications are regarded as exceptional. However, the condition may be confused with secondary syphilis, German measles, typhus and acute leukemia. A study of the blood picture usually settles the question. The disease may become complicated by cardiac disorders, bronchitis, albuminuria, hematuria and hepatic and splenic disorders. Spontaneous rupture of the spleen is an unusual occurrence; 7 such cases have been observed in the American army, 1 in the British and 2, which are briefly described, occurred in the author's wards in a Canadian army hospital. The central nervous system may become involved in the form of meningitis, encephalitis or both. Pain in the back of the neck is not uncommon in cases with posterior cervical glandular involvement, and at times it is accompanied with voluntary rigidity, which simulates that seen in meningitis.

Net Protein Value of Food Yeast. J. A. Goyco and C. F. Asenjo. —p. 593.

Vitamin C and the Menstrual Cycle.—In 10 women whose ascorbic acid metabolism was studied for a total of twenty-three periods of from four to six weeks duration, during which thirty menstrual periods occurred, Hauck found no evidence of unusual variability in either urinary excretion of ascorbic acid or fasting plasma ascorbic acid values associated with the menstrual cycle.

Dietary Fat Level and Nutrition.—Deuel and his associates show that ad libitum feeding to rats of diets varying in fat content from 5 to 50 per cent (10 to 70 per cent of total calories) results in better growth, greater physical capacity and better reproductive and lactation performance than does feeding of diets containing minimal amounts of fat. Optimum growth was observed on diets containing 20 to 40 per cent fat. The most pronounced differences were observed in males. The effects are in part, but not entirely, attributable to greater caloric intake of the diets containing fat.

Creeping Eruption in New England.—Lowe and Augustine say that, although creeping eruption is frequent in tropical and subtropical countries, this infection has been reported only once before in New England. One of the 2 cases of creeping eruption reported here was caused by Ancylostoma caninum of canine origin and was acquired in Boston. The second case, acquired in Georgia and observed in Boston, was probably caused by Ancylostoma braziliense. In view of the fact that Ancylostoma caninum is a relatively frequent parasite of dogs in New England, the question arises concerning the reason for the rarity of creeping eruption in the human population. The lack of a sufficient number of consecutive days with favorable temperature and moisture for larval growth of the parasite in New England soil, together with high hookworm infections in the dogs, does not permit the development of a heavy soil infection under most circumstances. Only in kennels and under unusual conditions, such as those in case 2, are soil infections likely to become sufficiently heavy and concentrated to cause creeping eruption.

Panophthalmitis in Premature Infant Treated with Streptomycin.—Somerville-Large reports the development in a premature infant weighing 4 pounds 5 ounces (1,955 Gm.) at birth of panophthalmitis following umbilical cord infection by Bacillus proteus, an organism resistant to penicillin and sulfonamides but highly sensitive to streptomycin. One Gm. of streptomycin was dissolved in 10 cc. of sterile water and 1 cc. was injected intramuscularly every three hours for a total of twenty-one hours. The dose was then reduced to 0.5 cc. three hourly for sixty-six hours and further reduced to 0.25 cc. every three hours until a total of 2.5 Gm. had been given. The treatment with streptomycin covered a period of six and a half days. On the ninth day from the commencement of streptomycin the globe perforated. Evisceration was carried out on the same day. The vitreous was found to be grossly infected. Swabs from the site of perforation, from the anterior chamber and from the vitreous were found to be sterile on culture. By the finding of Bacillus proteus in the anterior chamber prior to commencement of streptomycin treatment, and by the negative cultures obtained from the highly infected globe after treatment, it may be inferred that this drug is capable of permeating the uveal tissue. Three and a half months later the child was in good health. The streptomycin treatment had no ill effects.

Fluorine in Control of Dental Caries.—The results of epidemiologic investigations indicate that there exists an inverse relationship between the incidence of dental caries and the fluorine content of the water supply. A number of studies are in progress in the United States and in Canada to test the effectiveness of controlling caries by the fluorination of the water supplies. As the results of these studies will not be available for ten to twelve years, Martin considers it expedient that similar studies be commenced in Australia. It is assumed that the alteration of the fluorine concentration of the domestic water supplies to 1 part per million would be sound public health practice. The addition of sodium fluoride to water supplies presents no technical problems to the water works engineer. Automatic chemical feeding equipment which will add the requisite amount of sodium fluoride to the water (20½ pounds of sodium fluoride to a million gallons of fluoride-free water) is available and is inexpensive.

Prophylaxis of Postoperative Shock. M. Larget, J. Guilleminot and P. Grigaut.—p. 295.

Besnier-Boeck-Schaumann's Disease.—Pautrier points out that in recent times descriptions have appeared under the designation of Besnier-Boeck-Schaumann's disease of transitional types of atypical cases, establishing apparent relations between this disease and tuberculous lupus, erythematous lupus, the tuberculids, the hypodermic sarcoids of Darier-Roussy, disseminated follicular lupus and erythema nodosum. The same has been done with regard to the pathologic aspects resulting in overlapping with Hodgkin's disease or with mycosis fungoides. The author feels that the situation is deplorable in view of the fact that Besnier-Boeck-Schaumann's disease represents a well defined clinical and histologic entity.

Effects of Castration on Metastases of Mammary Cancer.—On the basis of observations on 11 patients with mammary cancer, Sicard concludes that in young women as well as in women beyond the menopause castration plays an important role in the evolution of metastases of cancer of the breast. It rapidly suppresses pains produced by bone and lymph node metastases, improves the general condition and temporarily stabilizes the lesion. Surgical castration seems to give much better results than does castration effected by irradiation. Treatment with testosterone proved ineffective in 2 cases.

Total Resection of Carcinomatous Stomach.—Wahren reviews observations on 9 patients, 8 men and 1 woman, who had cancer in the corpus portion of the stomach and had been treated by total resection. All of them were discharged from the hospital in good condition. The first death occurred from metastasis in the liver four months after discharge from the hospital. Three other patients died within a year after the operation. The author describes the technic of total resection and discusses the vascular supply of the anastomosis. He thinks that surgeons who have carefully studied the technic of total resection of the stomach need not anticipate a higher mortality rate than that occurring in partial resection. The operation ought to be used for cancer in the fornix and within the upper portion of the corpus as well as in certain scirrhoid processes. It is doubtful whether all cases of cancer of the stomach should be treated by radical resection. When one takes into consideration that cancer within the stomach is diagnosed at a late stage, it is far too optimistic to expect decidedly better results until the disease can be diagnosed in its precancerous stage.

Book Notices

Human Factors in Air Transport Design. By Ross A. McFarland, Ph.D. Cloth. Price, $6. Pp. 670, with illustrations. McGraw-Hill Book Company, Inc., 330 W. 42d St., New York 18, 1946.

This book was written for a purpose planned by the author over the last twenty years and for which there has been and is a very real need. It should be in the library of all physicians interested in aviation medicine as well as in the library of air line executives, especially those in the engineering and planning department, and at any school, such as the Massachusetts Institute of Technology and the California Institute of Technology, where aeronautical engineering is taught.

The accomplished aims of the author are to present factual information on all aspects of air transport design influencing those who operate the planes or travel by air, to furnish whatever interpretative background is necessary to show how a given physical variable creates a human problem and to offer recommendations or possible solutions concerning the human factors in air transport design. A summary is presented at the end of each chapter for those who do not wish to follow the more detailed exposition.

In the first chapter the author presents an analysis of the trends and characteristics of the aircraft industry, including the future technical developments and their implications. Subsequent chapters include flight at high altitude and pressurized cabins; the control of ventilation, temperature and humidity; the control of insects and air borne diseases; carbon monoxide and other noxious gases; the control of noises and vibration; acceleration, motion and flight performance; the cockpit and control cabin; passenger accommodation, and the prevention of aircraft accidents.

The most important point that the author desired to stress, that is, the demonstration of the fundamental importance of interaction of human and physical variables in the design and operation of air craft, has been accomplished. The necessity for reducing the time lag between research and its application has been repeatedly stressed. Undoubtedly subsequent editions will include a great deal of information that is on the restricted list of the army and navy air forces and British air forces at the time of publication.

Henrici's Molds, Yeasts, and Actinomycetes: A Handbook for Students of Bacteriology. By Charles E. Skinner, Ph.D., Assistant Professor of Bacteriology, University of Minnesota, Minneapolis, Chester W. Emmons, Ph.D., Principal Mycologist, Division of Infectious Diseases, National Institute of Health, Bethesda, Maryland, and Henry M. Tsuchiya, Ph.D., Research Associate, Division of Microbiology, Hormel Institute, University of Minnesota, Austin. Second edition. Cloth. Price, $5. Pp. 409, with 136 illustrations. John Wiley & Sons, Inc., 440 Fourth Ave., New York 16; Chapman & Hall, Ltd., 37-39 Essex St., Strand, London, W. C. 2, 1947.

The well known book by Henrici has been brought out in a second edition by three investigators, experts in their respective fields. The comparatively meager literature in the English language on the subject of fungi and actinomycetes as causative agents of human and animal diseases is receiving in this book most expert consideration. In addition, the authors present a detailed discussion of the utilization of fungi, yeasts and actinomycetes for industrial and food purposes. It is sufficient to list the subjects of the chapters to give an idea of the broad scope of this book: structure and classification of the fungi; variations in the lower fungi; methods for studying molds, yeasts and actinomycetes; molds belonging to the Phycomycetes; molds belonging to the fungi imperfecti and the Ascomycetes; fungous diseases of man and animals; infections caused by molds; biologic activities of molds; morphology and classification of the yeasts and yeastlike fungi; pathogenic yeastlike fungi; biologic activities of yeasts; classification, morphology and biologic activities of the actinomycetes; actinomycosis; antibiotic substances. Each chapter is followed by a selected bibliography. The book is exceptionally well written and carefully illustrated, mostly by photographs made by the late Dr. Henrici himself. The book can be read very easily. Although it is primarily designed as a textbook for students specializing in the field, many physicians interested in the subject of applied mycology, especially of fungi as causative agents of diseases, will find the book a valuable addition to their library.

Experiences with Folic Acid. By Tom D. Spies, M.D., Associate Professor of Medicine, University of Cincinnati School of Medicine, Cincinnati. Cloth. Price, $3.75. Pp. 110, with 38 illustrations. Year Book Publishers, Inc., 304 S. Dearborn St., Chicago 4, 1947.

This monograph records, in a group of essays, the historical data leading to the use of folic acid in the treatment of macrocytic anemias. The presentation differs from most American scientific works in that the personal experience of the author is given in the first person, with his interpretation and evaluation of the data as they evolved. There are four excellent colored plates. The author concludes that folic acid, while increasing the number of red blood cells in pernicious anemia, "does not always prevent the occurrence of combined system disease nor does it reverse the degenerative process once it has begun." He concludes that for the present, until more discoveries are made, "liver extract is the safest and most effective therapeutic agent for the routine treatment of pernicious anemia." The author purposely omitted a comprehensive report on all the earlier work in the treatment of anemia in which substances were used which might now be found to contain "folic acid."

The booklet will be helpful to any one who does not have available the extensive publications of Dr. Spies in numerous medical journals in this country and abroad.

Therapeutic Exercise. By F. H. Ewerhardt, M.D., Assistant Professor of Physical Medicine, Washington University School of Medicine and Barnes Hospital, St. Louis, Missouri, and Gertrude F. Riddle, B.S., R.N., R.P.T. Fabrikoid. Price, $2.50. Pp. 132, with 8 illustrations. Lea & Febiger, 600 S. Washington Square, Philadelphia 6, 1947.

This treatise is concise and well presented. It gives the functional treatment of joint structure and mechanics and an adequate coverage of muscle anatomy and physiology. There is an excellent chapter on the brachial and lumbosacral plexus, including a brief clinical discussion of peripheral nerve lesions. The remaining half of the book deals with the physiology and application of therapeutic exercise in general and specifically as applied to different areas and for various disabilities including weak feet, relaxed abdominal wall, scoliosis and posture in general. Separate chapters are devoted to poliomyelitis and spastic paralysis. The book can be highly recommended to physical therapeutists and general practitioners. Unfortunately, as in most textbooks on physical medicine, the collaboration of an orthopedic surgeon is lacking. Such an approach to the subjects covered would more clearly indicate the objectives sought for and the results which can reasonably be expected from physical therapeutics. Unfortunately weight resistance exercises are only mentioned and not discussed.

Diabetes Mellitus in Bergen 1925-1941: A Study of Morbidity, Mortality, Causes of Death and Complications. By Per Hanssen. Also published as Supplement, Acta medica scandinavica, 1946. Translated from Norwegian to English by Claude Lillingston, M.D. Paper. Pp. 179. Johan Grundt Tanum Forlag, Oslo, 1946.

This monograph is unique. It is an intimate study of diabetes in Bergen over a period of sixteen years. Interwoven in its pages are instructive comments on all phases of the disease and valuable references to the literature. The author is particularly well trained to prepare this review and analysis of diabetes because of his broad education at home and his association with Hagedorn in Denmark. The volume is a valuable contribution to the incidence of diabetes in a community particularly suited to such an investigation because of its stable population, but, more than this, brings out the fallacies inherent in estimations of diabetic morbidity from records of diabetic mortality. The author is obviously so well versed in statistical studies of diabetes that all who read his report cannot refrain from the hope that he will continue his interest in this disease and extend it by a more modern approach to the solution of diabetic morbidity by instituting a survey of the true incidence of diabetes in Bergen based on analyses of sugar in the urine and blood of a liberal section of Bergen's population. The results, when compared with the knowledge of diabetes in Bergen already acquired, would be of worldwide significance. What is needed today is the discovery of latent, early, mild diabetes, the victim of which is only too frequently the relatively impecunious diabetic citizen, because these are the very ones for whom treatment can accomplish the most.

Queries and Minor Notes

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards will not be noticed. Every letter must contain the writer's name and address, but these will be omitted on request.

TETANUS AFTER HUMAN OR DOG BITES

To the Editor:—There has been considerable discussion among our medical staff as to the administration of tetanus antitoxin in cases of wounds caused by human bites. Any institution for the mentally ill has quite a number of such cases. There seems to be little information in the literature or current textbooks available in our library concerning this subject. Is it advisable that tetanus antitoxin be administered to patients whose wounds are caused by bites inflicted by other patients?

Daniel Halfron, M.D., Elgin, Ill.

To the Editor:—I would appreciate information regarding the necessity for giving tetanus antitoxin following dog bites.

Samuel B. Hughes, M.D., Wildwood, N. J.

Answer.—1. A review of the available literature and of the statistics of several hospitals which admit a not inconsiderable number of patients with tetanus indicates that tetanus from human bites does not occur. Consequently tetanus antitoxin is not needed in the care of human bites. In view of the high incidence of human bites among inmates of institutions for the mentally ill, it might be advisable to cover all problems related to tetanus by a program of active immunization with tetanus toxoid. Three doses of fluid tetanus toxoid (1 cc. at two week intervals) or two doses of alum precipitated tetanus toxoid (0.5 cc. at monthly intervals), supplemented by a small booster dose (0.1 cc. of fluid or alum precipitated tetanus toxoid) in the event of injuries, would cover all exigencies, including the hypothetical occurrence of tetanus from human bites.

2. The available evidence indicates that tetanus from dog bites does not occur. If the tissues are contaminated with dirt or other material considered likely to harbor spores of the bacillus of tetanus, a prophylactic dose of 10,000 units of tetanus antitoxin cannot be condemned. The average dog bite does not require antitetanic serum. Obviously there is no harm associated with the injection of a small booster dose of tetanus toxoid (0.1 cc. of either fluid or alum precipitated material) into a patient who has been immunized previously with the material. However, in most instances it is not required. Tetanus antitoxin, in contrast to tetanus toxoid, may induce serum sickness. The latter, because of sundry factors, might lead to the abandonment of rabies inoculations. Obviously, active immunization against rabies following the infliction of a dog bite is of more importance than protection against tetanus.

SLOW HEART RATE AFTER EXERCISE

To the Editor:—What interpretation should be placed on the lack of rapid heart action after a period of exercise? To be specific: I have on several occasions observed that apparently healthy young men (U. S. Navy applicants) may show an initial pulse rate of 80 per minute, and after a standardized exercise test their pulse may be only 88 per minute whereas the average man's pulse would be 110 to 120 per minute. What conclusion should be drawn from prolonged rapid heart action following exercise? What conclusion should be drawn from drop in pulse rate and/or blood pressure following exercise?

E. J. Sullivan Jr., Lieutenant (jg) M.C., U.S.N.R.

Answer.—The failure of the heart rate to be much elevated after excercise is in most instances in young people a favorable sign of physical fitness and athletic training. The same is true of the rapid reduction of pulse rate on resting during the first two minutes after exercise. The maintenance of prolonged rapid heart action after exercise can be the result of overstrain of an abnormal heart, but it is more commonly the result of poor physical condition or of nervousness. In rare cases heart block may be responsible for a drop in pulse rate immediately after exercise. In such cases electrocardiographic study should be made. However, in certain athletes the sudden development of sinoauricular block with the halving of the pulse rate or close to it can occur within a minute after some exercise, such as a hundred yard dash, and in such cases is a favorable and economical physiologic mechanism.

The effect of exercise on the blood pressure may be quite similar to the effect on heart rate, but these effects often are not parallel; if the heart is weak or a state of collapse is produced the blood pressure may fall abruptly.

POISONOUS MOLLUSKS

To the Editor:—In The Journal, March 8, 1947 on page 708 under Medical News of Alaska I find a note regarding "Survey of Alaskan Clams." This note mentions Gonyaulax catenella in the clams found in southeastern Alaskan waters. The toxin from Gonyaulax is mentioned as causing paralytic poisoning, and it is noted that the federal Food and Drug Administration does not allow the sale of shellfish showing even a minimum amount of the toxin. May I ask for further information on this organism? Is it classed with the so-called plankton? Is it the same one which has caused trouble along the Oregon, California and Washington coasts at certain times of the year? How is the toxin determined?

Captain (MC), U. S. Navy.

Answer.—A paralytic toxin has been found at certain times in mollusks, particularly clams and mussels, along the coast of California, Oregon, Washington, both the East and West coasts of Canada and the coast of Alaska. According to Sommer and others the primary source of this toxin along the West Coast of the United States is a plankton organism, the dinoflagellate Gonyaulax catenella, which is utilized as food by the mollusks. However, the presence of this organism has not always been demonstrated elsewhere in areas where toxic clams and mussels have occurred. Regardless of the primary source, the toxins found so far in poisoned mollusks have similar if not identical pharmacologic properties.

There is no known chemical test for the identification or the determination of the toxin, so that biologic assay is necessary. In brief, this assay is carried out as follows: One hundred Gm. of the fresh meats are finely ground, mixed with 100 cc. of tenth normal hydrochloric acid, brought rapidly to boiling and boiled for five minutes. After cooling, centrifuging and adjusting the p_H to 4 to 6 if necessary, 1 cc. of the supernatant liquid is injected intraperitoneally into each of three 20 Gm. mice. The symptoms and time of death are noted. A mouse unit has been defined as that amount of toxin which when contained in 1 cc. will kill a 20 Gm. mouse in ten to twenty minutes. Since there is a relationship between death time and potency of the toxin, it is possible to approximate the potency from the average death time of the mice.

The Food and Drug Administration has advised the industry to refrain from taking clams from beds where more than the minimum demonstrable amount of toxin (200 mouse units) is present.

ADIPOSIS DOLOROSA

To the Editor:—Is there any treatment for adiposis dolorosa? My patient is a woman aged 30 with several children. Physical examination is not remarkable except for painful fatty deposits. The history reveals only pain, headache and periods of amenorrhea at times for several months. The basal metabolic rate is —9; chest films are normal. The blood shows a mild secondary anemia.

Luther B. Lowe, M.D., Chattahoochee, Fla.

Answer.—The pain in adiposis dolorosa sometimes disappears with loss of weight. It would therefore be well to put the patient on a weight reducing diet. As the patient has periods of amenorrhea and headache it would be desirable to have an x-ray of the sella turcica to rule out a pituitary tumor. She apparently has hypogonadism secondary to hypopituitarism and may therefore be given stimulation therapy with pituitary gonadotropin. If this is ineffective she may receive substitutional therapy with estrogenic substance.

VENTILATION OF HOMES

To the Editor:—In planning the construction of an eight room, three story house the heating engineer suggests that an outside air duct to the hot air furnace is not good principle. The heating system plan is a gas furnace with forced hot air; this may be in conjunction with a Precipitron. Is it likely if the house is occupied by four to six people that the air will be freshened sufficiently from the opening of the door, which may happen twenty to thirty times in twenty-four hours? I realize that the circulation of the air through the house will keep it from becoming stuffy, but my query is directed to the healthful aspect and comparative oxygen content.

M.D., Pennsylvania.

Answer.—In ordinary homes the spontaneous leakage of air through cracks and crevices and from the opening of doors is ample to maintain normal oxygen concentration and to keep the air fresh. It is desirable to ventilate kitchens and bathrooms by means or an exhaust fan in order to remove odors, excessive heat and moisture at the source.

Although an outside air duct is not necesssary on this score, it will be desirable to have one installed for cooling the building in the summer by the circulation of cool night air, without the necessity of keeping windows open all night. This "fresh" air pipe should be provided with a damper near the wall inlet and with a quadrant which can be locked shut in cold weather.

BAY RUM

To the Editor:—Can you give me a brief statement as to the harmful effects of drinking bay rum? Ernest Thompson, M.D., Monroe, Ga.

Answer.—Bay rum was originally made in the West Indies by distilling rum with the leaves of their native bay tree, Pimenta racemosa, which is not related to the bay berries of New England but belongs to the same family (Myrtaceae) as cloves and allspice. Bay rum is now prepared by dissolving 0.6 to 1 per cent of bay oil, the pungent aromatic volatile oil distilled from these leaves, the myrcia oil of the National Formulary, with smaller quantities of other aromatic oils, in diluted alcohol of 40 to 60 per cent. The compound spirit of myrcia, N. F. VIII, is typical. It contains myrcia oil 8 cc., orange oil 0.5 cc., pimenta oil 0.5 cc., alcohol 610 cc. and water to make 1,000 cc. Other formulas contain also the oils of clove, bergamot, lemon and rosemary, but the chief potent ingredients are the alcohol and the myrcia oil. This contains 50 to 65 per cent of phenols, including eugenol, and its pungent, irritative action is presumably due to these. The effects of bay rum would therefore correspond to those of its alcohol, perhaps somewhat stronger than "proof," with about 1 per cent of pungent volatile oil somewhat similar to clove oil. A single dose of 25 cc. of such a preparation, containing less than 0.25 cc. of the oil, would produce some gastric irritation but would probably not be harmful; continued use could conceivably cause chronic gastritis. A hundred cubic centimeters, corresponding to 1 cc. of the oil, could probably not be dangerous; 10 cc. of the oil could probably be fatal, but so could the alcohol in the corresponding amount (1,000 cc.) of bay rum. Bay rum hair tonics, however, usually contain varying amounts of cantharides, and this would produce priapism, hematuria and nephritis.

METHODS FOR DETERMINING SERUM PROTEINS

To the Editor:—I have a problem and would greatly appreciate your help. I am beginning to do protein and albumin determinations on blood serum, using a method described on pages 342 to 344 of the Laboratory Methods of the United States Army, edition 4, edited by James Stevens Simmons. This is apparently a modification of the Greenberg method using tyrosine as a standard and developing a blue color in both standard and unknown. The results have been to date too high for the total protein, at least as checked by another method. I have done this with the visual colorimeter but would prefer to plot a curve for use with the Cenco photelometer. However, using number 1 blue, number 2 green and number 3 red filters, I have not had a wide enough difference in the different readings to make really accurate estimations. Quite likely the use of another filter would correct this difficulty, and this is one of the things on which I would like advice. Also I would like to know whether, perhaps, the regular Greenberg procedure would be more satisfactory. If there are any other more recent methods which are not too complicated for a small laboratory and adaptable to the photoelectric colorimeter, I would be glad to be informed about them. Leon A. Alley, M.D., Middleboro, Mass.

Answer.—The method referred to is not included in the fifth edition of "Laboratory Methods of the United States Army," edited by James Stevens Simmons. Nor does it seem that this method using a tyrosine standard is easily adaptable to photoelectric colorimetry. It is suggested that a much better method is that described by G. R. Kingsley, "The Direct Biuret Method for the Determination of Serum Proteins as Applied to Photoelectric and Visual Colorimetry," *J. Lab. & Clin. Med.* **27**:840 (March) 1942. The author used the Klett-Summerson photoelectric colorimeter. The method has been adapted to the Coleman clinical spectrophotometer and can be used doubtless with the Cenco-Sheard-Sanford photelometer. A green filter transmitting light between 500 and 570 millimicrons with maximal transmission at 540 millimicrons is satisfactory. A calibration curve must be made, of course, for the particular instrument, for which some reliable quantitative method should be used for standardization.

DETERMINATION OF FERTILITY IN MEN

To the Editor:—What is the technic of a relatively simple method for the determination of fertility in men by office methods? I have a microscope, counting chamber and slides.

James K. Gray, M.D., Thurmont, Md.

Answer.—For the physician using the equipment listed, the tests most essential are the determination of the number of sperm per cubic centimeter, the percentage of abnormal forms present and the motility of the sperm.

The number of sperm in 1 cubic centimeter is obtained by filling a white blood pipet to the 0.5 mesh with seminal fluid. A solution of 5 per cent sodium bicarbonate and 1 per cent solution of formaldehyde is added as a diluting fluid to the 11 mark on the pipet.

Using a white cell counting chamber, count the number of sperm in 1 square millimeter. Multiplying this number by 10, then by 1,000 and then by 20 will give the number of sperm per cubic centimeter.

To determine the number of abnormal forms, smear the seminal fluid on a slide, slightly heat to fix and stain with gram stain.

The motility can be observed by examining a fresh drop of seminal fluid under the microscope.

Normally 1 cc. of ejaculate should have a minimum of 20 million sperm per cubic centimeter.

The maximum number of abnormal forms should not exceed 24 per cent. Lack of motility does not always indicate sterility.

MENSTRUATION DURING PREGNANCY

To the Editor:—Please explain why women will menstruate regularly while pregnant and deliver full term babies? I have witnessed several cases but was unable to explain the mechanism.

George Vash, M.D., Chester, Mass.

Answer.—In the De Lee-Greenhill Principles and Practice of Obstetrics, page 117, appears the following statement concerning this question: "Menstruation may continue after conception. It is not rare to learn of a woman having one or two periods after she is pregnant, but usually the amount of blood is small and the character of the flow otherwise abnormal. Bleeding after conception is the rule in macacus monkeys, and Hartmann calls it the "placental sign." A true menstrual flow is possible, because the two deciduas do not fuse until the fifth month. Instances in which menstruation persisted during the nine months have been reported. The ovary sometimes continues to function during gestation, as proved by instances of superfetation, of menstrual molimina and autopsies on pregnant women. Rather than a menstruation a bloody discharge is more likely due to abortion, cervical erosions, uterine polyp, fibroids, rupture of a varix at any point in the cervical, vaginal or vulvar canal, extrauterine pregnancy and diseases of the ovum, such as placenta previa."

DOES LIVER EXTRACT OR VITAMIN A DAMAGE THE LIVER?

To the Editor:—Is there any danger of inducing liver damage by repeated injections of liver extract or by the ingestion of large doses of vitamin A over a long period of time? M.D., New York.

Answer.—There is no good evidence that either of these substances damages the liver in therapeutic doses even when given over a long period. There is one possible exception, however, namely the presence of hypersensitivity to liver extract. Under such circumstances it is possible that liver damage may be produced.

CLEANING SURGICAL INSTRUMENTS

To the Editor:—I am wondering what suggestions you may have for the cleaning of surgical instruments. I have been using the patented cleaner "Hemosol" but would welcome a more efficient, practical cleanser. D. E. Rolf, M.D., Cleveland.

Answer.—The most effective way of cleaning instruments seems to be by using a brush with soap and water.

VAGINAL DOUCHING

To the Editor:—In the Feb. 15, 1947 issue of The Journal page 508, there was a note on vaginal douches. A previous query said "for those who insist douches should be used not oftener than once or twice a week at most." This statement I wish to agree with since studying the physiology of the vagina before, during and after douching with certain chemicals in tap water and also after no douching at all. This work has been going on at the Jefferson Davis Hospital department of gynecology for the past thirteen years. Hydrogen ion concentration (pH) of the normal vagina was found to be 4.36; after vinegar douches it was 4.49, or1,130 times less acid than normal, after water douches 6.0, or 5,400 times less acid than normal, after veraseptol douches 5.59, or 4,258 times less acid than normal, after soda douches 6.61, or 4,345 times less acid than normal, after saponated solution of cresol douches 5.62, or 4,130 times less acid than normal, after glucose douches 4.57, or 1,678 times less acid than normal, after sodium chloride douches 7.45, or 4,367 times less acid than normal, after zonite douches 6.72, or 4,351 times less acid than normal, and after alum douches 4.20, or 1,940 times more acid than normal. After no douches and no infection of the vagina, the pH was found to be 4.49, or the same as if the patient had been taking vinegar douches. In infections of the vagina, douches are necessary twice a day in order to wash out the nonphysiologic and irritating vaginal secretion. Without infection, a douche is not necessary except as a cleansing douche after coitus.

Karl John Karnaky, M.D., Houston, Texas.

PULMONARY EMBOLISM IN MEDICAL PATIENTS

A Comparison of Incidence, Diagnosis and Effect of Treatment in Two Hundred and Seventy-Three Cases at the Massachusetts General Hospital in Two Five Year Periods (1936 to 1940 and 1941 to 1945 Inclusive)

JACQUES CARLOTTI, M.D.
IRAD B. HARDY Jr., M.D.
ROBERT R. LINTON, M.D.
and
PAUL D. WHITE, M.D.
Boston

Pulmonary embolism in medical patients is not infrequent and, contrary to general opinion, is actually commoner than pulmonary embolism occurring postoperatively. It has often been overlooked during the life of the patient even by experienced physicians, and it is still clinically diagnosed in probably less than half of the medical patients in whom it is discovered at autopsy. It was the experience of one of us (P. D. W.) [1] five years ago that pulmonary embolism was diagnosed personally nearly ten times as often in the decade from 1931 to 1940 inclusive as in the previous decade from 1921 to 1930, although the patients suffered from the same kinds and degrees of cardiac disease in the two decades. The answer obviously was twofold: first, the possibility of this condition was borne in mind and second, the criteria for diagnoses became more clearly defined with experience.

Death from pulmonary embolism is still a dreaded complication in hospitalized patients. Only a few years ago preventive measures directed against this fearsome event were practically nil and therapeusis was almost entirely conservative. Occasional heroic attempts at the Trendelenburg operation were met with almost routine failure. The phlebitis which was frequently associated with the embolic episode was treated solely by heat, rest and elevation of the affected part.

In recent years a decided interest in thromboembolic disease has been reflected in the large number of articles appearing in the literature on this subject. Most of this material has emphasized the frequency of pulmonary embolism in surgical patients, that is, after operative intervention, fractures and childbirth. Prophylaxis has been emphasized,[2] and treatment has been suggested along two lines: (a) interruption of the femoral veins [3] and (b) use of the anticoagulants heparin [4] and "dicumarol." [5]

At the Massachusetts General Hospital the chief method of treatment of thromboembolic disease in surgical patients during the last seven years has been bilateral interruption of the femoral veins. Because of the beneficial results obtained by this form of therapy in the surgical cases, it was natural that an increased interest in pulmonary embolism and infarction in medical patients was aroused. This interest was further stimulated in 1940 by the work of Hampton and Castleman.[6] In a study of the postmortem observations in a group of 370 cases of pulmonary embolism 40 per cent were postoperative and the remaining 60 per cent occurred in medical patients, approximately half of whom had cardiac disease. They also found that with the possible exception of those in the cardiac group 95 per cent of the emboli arose from the veins of the legs.

The purpose of this paper is to analyze the cases of pulmonary embolism occurring in medical patients at the Massachusetts General Hospital from 1936 to 1945, a ten year period, and to compare the results of conservative treatment in the five year period from 1936 to 1940 with those obtained in a second five year period (1941 to 1945) during which interruptions of the femoral veins were carried out.

Femoral vein interruption in these medical patients has, as a rule, been preferred by us to anticoagulant therapy because of its immediate control of the danger and because of its greater practicability in clearing the threat of recurrent or chronic leg vein thrombosis once and for all, especially in cardiac cases of complete or partial invalidism with myocardial failure and resulting peripheral circulatory stasis

INCIDENCE OF EMBOLISM AND INFARCTION

The incidence of pulmonary embolism and infarction in medical and surgical patients for the years 1936 to 1945 was determined (table 1). During that period there were 45,523 admissions to the medical services and 98,642 admissions to the surgical services. Since there were 273 cases of pulmonary embolism on the medical services and 238 cases on the surgical services, the mean incidence of pulmonary embolism or infarction during the years 1936 to 1945 was 0.6 per hundred patients on the medical services and 0.24 per hundred patients on the surgical services. In this ten year period 53.4 per cent of all cases of pulmonary embolism occurred in medical patients. This figure corresponds roughly with that given by Hampton and Castleman.[6]

TABLE 1.—*Incidence of Pulmonary Infarction or Embolism in Medical and Surgical Patients*

	Total Cases		Cases of Infarct or Embolism		Percentage	
Year	Medical	Surgical	Medical	Surgical	Medical	Surgical
1936	4,558	9,609	7	12	0.15	0.12
1937	4,578	9,606	27	24	0.56	0.24
1938	4,587	9,342	34	32	0.74	0.34
1939	4,907	9,005	31	22	0.63	0.24
1940	4,990	9,886	23	19	0.46	0.19
1941	4,969	10,610	35	28	0.70	0.26
1942	4,828	10,626	36	28	0.74	0.26

1945	3,838	9,346	22	25	0.57	0.27
Total	45,523	98,642	273	238		
Average yearly incidence					0.60	0.24

TABLE 2.—*Pulmonary Embolism in Medical Patients*

	Group A 1936-1940		Group B 1941-1945		Total Number of Cases 1936-1945
	No.	%	No.	%	
Number of cases	122		151		273
Definite (autopsies)	34	27.8	56	37.0	
Definite (clinically)	74	60.7	74	49.0	
Probable	14	11.5	21	14.0	
Deaths	52	42.6	73	48.0	
Autopsies	34	65.3	56	76.7	

CLASSIFICATION, DEATHS AND AUTOPSIES

The 273 cases of pulmonary embolism or infarction observed in medical patients during the ten year period have been divided into two groups: *A*, 122 cases occurring during 1936 to 1940, inclusive, and *B*, 151 cases for 1941 to 1945, inclusive. In table 2 these groups have been subdivided into three classes. The definite (autopsy) cases were those proved by postmortem examination. The definite (clinical) cases were those in which the clinical diagnosis was strongly supported by the physical observations, including thoracic pain and bloody sputum, the roentgenogram of the chest and the electrocardiogram. The probable cases were those in which the diagnosis of embolism or infarction was definite but was not always supported by all criteria. The percentage of cases in each classification was roughly the same for both five year periods.

In group *A* there were 52 deaths, a mortality rate of 42.6 per cent, and there were 34 autopsies, an autopsy percentage of 65.3. In group *B* there were 73 deaths, a mortality rate of 48 per cent, and there were 56 autopsies, an autopsy percentage of 76.7.

SEX AND AGE

An analysis of groups *A* and *B* (table 3) reveals that in both groups there was a slight predominance of male patients. In group *A* there were 69 males (56.5 per cent) and in group *B* there were 91 males (60.3 per cent). The striking influence of age on the incidence of pulmonary embolism is also shown in table 3. In group *A* 83.8 per cent of the cases and in group *B* 87.4 per cent occurred in patients over 40 years of age. These figures agree with a similar analysis in surgical patients published in 1943 by Allen, Linton and Donaldson.[2b]

RELATIONSHIP OF HEART DISEASE TO PULMONARY EMBOLISM

The impression has long existed that the rate of blood flow is an important factor in regulating the formation of thrombus. This has been pointed out by Murray and MacKenzie[4b] and de Takats,[3c] among others. In a similar manner cardiac disease has long been linked with venous thrombosis and pulmonary embolism. As previously stated, Hampton and Castleman [6] found that 60 per cent of their cases of pulmonary embolism were in medical patients, half of whom had cardiac disease.

In our study we found an even higher incidence of cardiac disease (table 4), which afflicted 59 per cent of the patients in group *A* and 70.8 per cent of those

TABLE 3.—*Sex and Age*

		Group A 1936-1940 122 Cases			Group B 1941-1945 151 Cases		
		No.	%		No.	%	
Sex	Male	69	56.5		91	60.3	
	Female	53	43.5		60	39.7	
Age	0 - 10	0	0.0		0	0.0	
	10 - 20	1	0.8		3	2.0	
	20 - 30	9	7.4		3	2.0	
	30 - 40	10	8.0		13	8.6	
	40 - 50	24	19.7		22	14.6	
	50 - 60	34	27.9		42	27.8	
	60 - 70	28	23.0	83.8	44	29.1	87.4
	70 - 80	15	12.4		22	14.6	
	80+	1	0.8		2	1.3	
	Total	122	100.0		151	100.0	

TABLE 4.—*Relationship of Cardiac Disease*

	Group A 1936-1940 122 Cases		Group B 1941-1945 151 Cases	
	No.	%	No.	%
Cardiac	72	59.0	107	70.8
Noncardiac	50		44	
Previous disease				
Hypertensive heart disease	26		33	
Rheumatic heart disease	30		31	
Coronary heart disease	16		25	
Phlebitis	12		11	
Clinical diagnosis on admission				
Congestive failure	52		52	
Pulmonary infarct or embolism	23		52	
Pneumonia	13		17	

in group *B*. There was a frequent history of hypertensive, rheumatic or coronary disease of the heart.

In at least one third of the patients in each group the clinical diagnosis on admission was congestive heart failure. This observation coincides with the old belief that venous stagnation plays an important role in thromboembolic disease

TABLE 5—*Analysis of Symptoms*

	Group A 1936-1940 122 Cases		Group B 1941-1945 151 Cases	
	No	%	No	%
Symptoms				
Pain in the chest	60	49.1	86	56.9
Dyspnea	39	31.9	54	35.7
Hemoptysis	14	11.4	28	18.5
Admitted with symptoms of infarct	60		90	
Infarct after admission to hospital	62		61	

TABLE 6—*Clinical Chart*

	Group A 1936-1940 122 Cases	Group B 1941-1945 151 Cases
Temperature		
100 F or over on admission	37	40
Sharp rise in hospital (98 to 102 F)	47	42
Pulse rate		
100 or over on admission	42	36
Sharp rise in hospital (90 to 110)	60	42
Respiratory rate		
30 or over on admission	27	21
Sharp rise in hospital (20 to 30)	48	33

An admission diagnosis of pulmonary infarct or embolus (table 4) was made relatively more frequently in group *B* than in group *A* This was probably due to the increased interest in pulmonary embolism and infarction during the period 1941 to 1945

ANALYSIS OF SYMPTOMS

Table 5 points out briefly the commoner symptoms of infarction or embolism found in both groups Pain in the chest was the symptom most frequently observed (49.1 per cent and 56.9 per cent) and was associated at times with either dyspnea (31.9 per cent and 35.7 per cent) or hemoptysis (11.4 per cent and 18.5 per cent) Those symptoms have been shown to predominate by other writers, among them Krause and Chester,[7] who found hemoptysis in 47, or 65 per cent, and thoracic pain in 23, or 32 per cent, of a group of 73 patients with pulmonary infarction

The symptoms of infarction either were present at admission or developed during a definite episode while the patients were in the hospital

CLINICAL CHART

Allen[3d] has pointed out the frequency with which a simultaneous rise of temperature, pulse rate and respiratory rate may be the first indication of pulmonary embolism Table 6 reveals that in both groups in our study this phenomenon was frequently observed At times this change occurred hours before any other subjective symptom or sign of embolism appeared In recent years at the Massachusetts General Hospital an unexplained concomitant elevation of temperature, pulse rate and respiratory rate calls for a meticulous search in an effort to rule in or rule out thromboembolic disease as a causative factor.

PHYSICAL EXAMINATION

The usual pulmonary observations on physical examination of patients in both groups of pulmonary embolism or infarction were rales, dulness and diminished breath sounds (table 7). In less than 10 per cent of either group was a friction rub found during physical examination. Signs of fluid were reported in a relatively small per cent of each group.

ROENTGENOGRAPHIC DATA

The most interesting observation in an analysis of the roentgenographic interpretations for the ten year period 1936 to 1945 was the increased frequency with which a definite diagnosis of infarction was made during the second five year period In group *A*, as shown in table 8, a diagnosis of infarction was made only 36 times (33.3 per cent). In group *B* a diagnosis of infarction was made on 73 occasions, or in 60 per cent of the cases, and at the same time the indefinite interpretation, consolidation, was made much less frequently in group *B* The increased ability of the members of the department to make a definite diagnosis of infarction coincided with the increase in general interest in thromboembolic disease Fleischner, Hampton and Castleman[8] in 1941 published an article which did much to establish the roentgenographic diagnosis of pulmonary infarction In those cases (table 8) in which infarction or consolidation were not reported, the usual observations were fluid or atelectasis There was a small percentage of patients in each group in whom normal lung fields were reported.

TABLE 7—*Observations on Physical Examination*

	Group A 1936-1940 122 Cases		Group B 1941-1945 151 Cases	
	No	%	No	%

Fluid	10	9.3	12	9.8
Atelectasis	6	5.5	6	4.9
Clear	4	3.7	8	6.5

ELECTROCARDIOGRAPHIC INTERPRETATION

Murnaghan, McGinn and White[9] have described the changes in the electrocardiographic pattern found in the presence of pulmonary infarction and embolism. They have pointed out the obscuring influence of preexisting cardiac disease and the necessity for early study in cases in which right ventricular strain is only temporary. In table 9 are listed the electrocardiographic interpretations in both groups. The most frequent aberrations from normal were due to coexisting disease of the heart. However, in 23.6 per cent of those examined in group *A* and in 11.8 per cent of those examined in group *B* there were changes which fell into the pattern designated as cor pulmonale complex. This complex consists in (1) the appearance of an S wave in lead 1, or its exaggeration if already present; (2) the appearance of a Q wave in lead 3, or its exaggeration if already present; (3) the inversion of the T waves in lead 3, or deepening of inverted T waves if already present; (4) the inversion of the T waves in the precordial leads overlying the right ventricle, CF_2 to CF_4, and (5) the lowering to inversion of the T waves in lead 2. In addition right bundle branch block had infrequently been associated with the complex.

AUTOPSY OBSERVATIONS

There were 34 autopsies in group *A* and 56 autopsies in group *B* (table 10). The pathologic observations of interest in our study of pulmonary embolism and infarction were chiefly related to the lungs, the heart and the veins of the legs. Pulmonary embolus and/or infarct was found in all cases. In group *A*, 17 of 34 autopsies (50 per cent) showed massive pulmonary emboli; in group *B* there were 10, or 17.8 per cent, among 56 autopsies. We believe that this definite reduction in the frequency of massive embolus is related to the attempt in recent years to be on the lookout for warning signs or symptoms of infarction or phlebitis so that measures to prevent fatal embolism may be taken. Welch and Faxon[10] have pointed out that 1 of 4 patients in whom there develop nonlethal pulmonary embolisms is apt to die of massive pulmonary embolism.

Associated cardiac disease was a common observation in the postmortem examination in both group *A* and group *B* (table 10). Rheumatic heart disease was found in 23.5 to 30.3 per cent of the cases. Myocardial infarction, recent or old or both, was found in 20.5 to 42.8 per cent of the cases. Mural thrombus formation likewise was frequently observed.

An interesting observation was that bilateral or right-sided mural thrombosis was found only in 11.4 per cent of the patients in group *A* and in 14.2 per cent of those in group *B*. In most of the standard textbooks and systems of medicine the right side of the heart is indicated as the origin of pulmonary embolism in medical patients, especially those with cardiac disease. More recently, the veins of the legs have been pointed out to be the source of pulmonary emboli. Hampton and Castleman[6] reported that with the possible exception of the cardiac group 95 per cent of the pulmonary emboli seemed to arise from the veins of the legs. Barker and associates[11] in a study of 1,665 consecutive cases of postoperative venous thrombosis and pulmonary embolism found thrombosis in the lower extremities in 85 per cent of their cases.

In our study of the postmortem examinations of medical patients we found scattered instances (table 10) of isolated thrombosis of the vena cava, the iliac veins and the pelvic veins, but in group *A* 78.9 per cent and in group *B* 75 per cent of those in whom the veins of the legs were examined showed thrombosis. These figures are in decided contrast to the observations for thrombi originating in the right side of the heart and would appear strongly to designate the veins of the legs as the usual origin of pulmonary embolism and infarction. Unfortunately, examination of the peripheral veins is not always accomplished in postmortem examinations. This important omission is usually due either to autopsy restrictions or to haste on the part of the examiner.

It is interesting to note that, in the 30 cases in group *B* in which thrombosis of the veins of the legs was found, 9 were patients who had undergone interruption of the femoral vein. In these 9 postoperative cases clot was found proximal to the ligature in 5 instances, but none of these patients had had massive clinical pulmonary episodes following venous interruption.

INTERRUPTION OF THE FEMORAL VEIN

From 1941 onward at the Massachusetts General Hospital interruption of the femoral vein was undertaken in cases in which a diagnosis of pulmonary embolism or infarction had been made in medical patients. Homans had demonstrated the efficacy of this procedure some time previously.[3a] Interruption of the femoral veins had already been instituted on the

surgical services, and the results of the procedure since then have been reported by Allen and his co-workers.[3b, d]

Table 11 reveals that in the 151 cases of group *B* (1941 to 1945) there were 60 operations to interrupt femoral veins. At first a unilateral interruption was performed as a rule. In 1941 and 1942 when interruptions of the femoral vein were relatively new and the procedure had not been standardized, it was considered that a unilateral operation on the apparently involved side was the procedure of choice. It soon became evident, however, that a bilateral operation gave the patient much more protection; several cases were reported in which large emboli arose postoperatively from the supposedly uninvolved side. Since 1943 bilateral operations have been done routinely (table 11), even though the signs of venous thrombosis are present in only one extremity.

1944	21	3	0
1945	10	1	0
Total	60	12	4

In 60 patients, 14 had the common femoral vein interrupted distal to the saphenofemoral junction and 36, the superficial femoral veins distal to the profunda femoris vein. In 10 cases the procedures were not clearly designated in the operative note but were in all probability performed on superficial femoral veins. We consider that in this group of patients, chronically ill with cardiac disease for the most part, interruption of the common femoral vein is indicated in order to eliminate the profunda femoris vein as a source of secondary emboli.

Thrombus was found at the time of operation in the common femoral vein on 12 occasions and in the superficial femoral vein 4 times (table 12). In the last two years of the study, 1944 and 1945, thrombus was found at operation in only 4 of 34 cases as compared to this observation in 5 of 6 cases in 1941. This indicates that the operative procedures are now being undertaken sooner and that the thrombi, which originate usually in the calf, have not had time to propagate as far as the level of the femoral veins.

There were a few cases of persistent swelling, sepsis and lymphatic fistula reported as complications in this group of 60 operations. The complication of greatest interest, however, is probably that of postoperative pulmonary infarction (table 13).

There were 13 of the 60 patients who had postoperative episodes which strongly suggested pulmonary infarction. On analysis of these 13 cases it was found that none of the secondary episodes was massive or fatal. It was also found that only 2 of the secondary infarctions occurred in patients whose common femoral veins had been interrupted. Eleven of the 13 episodes followed interruption of the superficial femoral veins. This would seem to bear out the belief that in this particular group of chronically ill patients interruption of the common femoral vein should be the procedure of choice.

There were 17 deaths in the 60 patients with operative intervention. In the 91 patients of group *B* who were not operated on plus the 122 patients of group *A*, a total of 213 cases, there were 108 deaths. The mortality rate (table 14) for this operated group is therefore 28.3 per cent and that for nonoperated cases 50.7 per cent. Since the patients who had interruptions of the femoral veins were not selected because of their good risk qualities, we consider that this method of treatment has been of definite significance in reducing the death rate from pulmonary embolism in medical patients.

The mortality in these medical patients, the considerable majority of whom had serious heart disease, has of course been far greater than that in surgical (postoperative) patients undergoing the same operative interruption of the femoral veins for pulmonary embolism. The reason lies, of course, in the precarious cardiac status of the medical patients, who may die of heart failure despite their temporary rescue from fatality due to the complicating pulmonary embolism.

Mortality	28.3%	50.7%

SUMMARY AND CONCLUSIONS

1. An analysis has been made of the incidence, symptoms and signs and treatment of pulmonary embolism in medical patients at the Massachusetts General Hospital during two five year periods, from 1936 to 1940 inclusive (group *A*) and from 1941 through 1945 (group B).

2. During the entire ten years the ratio of patients with pulmonary embolism on the medical wards (0.6

per cent) was more than twice that on the surgical wards (0.24 per cent). Although there were actually more than twice as many surgical cases (98,642) as medical (45,523), more than half (53.4 per cent) of all the patients with pulmonary embolism were medical (273 as compared to 238 surgical).

3. Of the 273 medical cases of pulmonary embolism 122 were diagnosed during the first five years and 151 during the second, the larger incidence being due in part at least to improvement in diagnostic ability.

4. Male patients predominated, making up 56.5 per cent of the first group and 60.3 per cent of the second.

5. The great majority of the patients were over 40 years of age (83.8 per cent), and over half were from 50 to 70 years of age.

6. The majority of the patients had cardiac disease (59 per cent in group *A* and 70.8 per cent in group *B*). All types of cardiac disease were represented, especially the rheumatic, hypertensive and coronary forms. Congestive failure was frequent as a background, and auricular fibrillation was present in nearly one third of the patients.

7. Of symptoms, pain in the chest (chiefly pleural) was the commonest but not the earliest, being found in about half the cases (49.1 and 56.9 per cent in groups *A* and *B*, respectively). Dyspnea was present in one third (31.9 and 35.7 per cent), but hemoptysis occurred only in a relatively small group (10.4 and 18.5 per cent). Tachycardia out of proportion to the degree of fever or dyspnea was a prominent sign. Physical abnormalities in the chest were often absent; a pleural friction rub was found in less than 10 per cent of the cases (9.8 and 8.6 per cent).

8. The roentgenologic diagnosis of pulmonary infarction improved considerably in the second five year period as compared with that in the first (57:33 per cent).

9. The electrocardiographic pattern of the acute cor pulmonale was evident in about one fifth of the patients who were so examined.

10. Autopsies in 90 (72 per cent) of the 125 patients who died showed massive embolism in 50 per cent, but only in a few cases (12) were mural thrombi found in either chamber of the right side of the heart. In over 75 per cent of the cases in which the veins of the legs were examined thrombosis therein was disclosed.

11. In only 1 case encountered during the first five year period were the femoral veins interrupted; but in the second period the operation was done bilaterally on either the superficial or common femoral veins (the latter are the preferable sites) in 60 patients, with a reduction of early mortality (within one month) to 28.3 per cent as compared with 50.7 per cent in those without operative treatment, the remaining deaths being in large part the result of congestive heart failure and not of recurrent pulmonary embolism.

12. The possibility of pulmonary embolism in medical patients, especially in cardiac cases, should be constantly borne in mind and when discovered, should be treated by bilateral interruption of the common femoral veins to prevent recurrent embolism which could prove fatal. This interruption must always be distal to the sapheno-femoral junction because if it is done proximal to it persistent lymphedema of the entire extremity will develop; we have also pointed out that this interruption should be proximal to the profunda femoris.

THROMBOSIS OF THE CAVERNOUS SINUS

Newer Concepts in Its Management and Report of Three Cases

SAMUEL L. FOX, M.D.
and
G. BROOKS WEST Jr., M.D.
Baltimore

Though thrombosis of the cavernous sinus is not common, it is not sufficiently rare to warrant reporting isolated cases unless they possess some unusual aspects. In this article we have endeavored to survey the existing literature, both before and since the advent of chemotherapy and the anticoagulants, and to report 3 cases with unusual aspects.

The term "cavernous sinus thrombosis" is used in a generic sense and includes cases of phlebitis, thrombophlebitis and phlebothrombosis as well as true aseptic thrombosis. By far the majority of cases reported are of septic origin and would therefore be classified as phlebitic or thrombophlebitic. Aseptic thrombosis and phlebothrombosis are usually secondary to trauma, a failing circulation or to other noninfectious inflammation of the cavernous sinus.

Although thrombosis of the cavernous sinus is usually unilateral in its clinical manifestations, there is almost always bilateral involvement histopathologically because of the anatomic communications between the two cavernous sinuses by way of the anterior and posterior basilar sinuses, situated on the floor of the sella turcica under the pituitary body.

HISTORICAL DATA

The first case of thrombosis of the cavernous sinus observed at autopsy was described by Duncan[1] in 1821. The first clinical report was made by Vigla[2] in 1839. In 1902 Dwight and Germain[3] surveyed the literature and collected 178 cases, to which they added 4 of their own, and in 1918 Smith[4] estimated that 300 cases had been reported since the disease was first recognized. In 1936 Grove[5] published an extensive survey of the literature up to that time and noted that the total number of reported cases was "not much in excess of 400." Obviously there had been more cases, but many were undiagnosed and not all diagnosed cases were reported. It is not always possible to establish the diagnosis clinically, and, as pointed out by Eagleton,[6] the cavernous sinus is not always examined at autopsy in obscure cases of septicemia. The cases cited and reported by Grove[5] occurred before the availability of chemotherapeutic drugs and showed an extremely grave prognosis. To quote from Grove,[5] "The percentage of recovery from all types of thrombosis of the cavernous sinus is probably not greater than 7 per cent. The percentage of recovery from the purely aseptic types is considerably higher than this." Since 1936 many

cases have been reported in which the sulfonamide compounds and penicillin have been employed, and the recovery rate has been much higher. No attempt will be made to present a complete bibliographic review of the cases reported thereafter, because little would be gained by such a review. The primary advances in the cases reported since 1936 are the use of sulfonamide drugs, penicillin and anticoagulants, the general abandonment of surgery of the cavernous sinus and the much higher rate of recovery.

ETIOLOGY

There are two primary types of thrombosis of the cavernous sinus: aseptic thrombosis and septic thrombosis. The aseptic type may result from trauma to the head (as in fractured skull); from direct trauma to the sinus from puncture wounds, either by violence or operative accident, or from a failing circulation in debilitated patients at the extremes of life (marasmic thrombosis). In the last group the thrombosis is always sterile and seldom primary, whereas in the traumatic group the thrombosis is usually sterile but the sinus may be directly infected at the time of injury. Traumatic thrombosis may occur as late as one month after injury.

The septic type of thrombosis is by far the commonest, is of infectious origin and is secondary to a focus elsewhere. As expressed by Lederer,[7] there are four recognized routes of infection:

1. Anterior foci: Such infections result from suppurations of the upper lip, ala nasi, vestibule of the nose and eyelids and spread by way of the angular, supraorbital and supratrochlear veins to the ophthalmic veins. This is the commonest route of infection.

2. Internal foci: These infections occur as a result of intranasal operations on the septum, turbinates and sinuses; after the use of the actual cautery in the nose during the stage of acute infections, and from suppuration of the posterior ethmoid and sphenoid sinuses, rarely the antrums. The infection is spread directly through the ethmoidal veins or through the wall of the sphenoid sinus.

3. Inferior foci: Such infections develop from peritonsillar abscess, operations on the tonsil, operations on osteomyelitis of the superior maxilla, maxillary dental extractions and deep cervical abscess. They spread by way of the pterygoid plexus or by direct proximal (retrograde) extension of the internal jugular vein through the lateral sinus and the petrosal sinuses.

4. Posterior foci: These infections occur as a result of extensive involvement of the middle ear and mastoid with lateral sinus phlebitis or thrombosis and spread in a retrograde manner through the petrosal sinuses to the cavernous sinus.

DIAGNOSIS

The onset of thrombosis of the cavernous sinus is usually manifested by a severe chill, a high temperature ranging from 102 to 105 F., extreme toxicity and perhaps nausea and vomiting. There is headache, but the patient is mentally alert until meningeal involvement occurs. The first localizing sign is definite edema of the bulbar conjunctiva and chemosis of the eyelids, with rapidly progressive exophthalmos of the eye on the affected side, usually becoming bilateral unless the disease is arrested or the patient dies. There is also limitation of the movement of the eye (abducens or sixth nerve paralysis), with concomitant alterations in sizes of the two pupils. Meningitis usually occurs rather early, after which the sensorium is decidedly affected. Fundal examination reveals dilatation of the retinal veins but seldom papilledema. There may be some swelling in the region of the mastoid on the affected side, owing to the exit in this region of an emissary vein in connection with the sinuses that communicate with the cavernous sinuses. Blood culture is usually positive if no chemotherapy has been administered.

The clinical diagnosis of this disease is usually not difficult. However, the absolute correctness of the diagnosis can only be established in those cases examined at autopsy. The acute onset, toxicity, sustained high fever and the characteristic ocular observations are classic signs of the disease.

Eagleton[6] presented certain criteria for establishing the diagnosis: (*a*) a known site of infection; (*b*) an infection of the blood stream; (*c*) early signs of venous obstruction; (*d*) involvement of the nerves in the sinus; (*e*) a neighborhood abscess of the soft parts, and (*f*) symptoms of complicating disease.

The two commonest conditions which must be differentiated from thrombosis of the cavernous sinus are orbital cellulitis and lateral sinus thrombosis. In the latter disease the onset is gradual and almost always follows an infection of the middle ear or of the mastoid or an infection in the neck. Fever is intermittent, and the temperature chart is typical, with extreme elevations associated with chills followed by remissions to normal. The blood culture is usually positive in thrombosis of either blood sinus (provided no chemotherapy has been administered), and involvement of the cavernous sinus may be a complication of lateral sinus thrombosis.

Orbital cellulitis remains unilateral and is unassociated with the extreme toxemia observed in thrombosis of the cavernous sinus. Retrobulbar aspiration usually proves positive in orbital cellulitis, and there is usually no alteration in the size of the pupils. There may be limitation of motion of the eyeball due to pressure, but a true paralysis of the cranial nerve does not occur.

Other conditions which must be considered in differential diagnosis are cellulitis of the cheek and face when accompanied by edema of the eyelids, infection of the ethmoids and frontal sinuses, tumors of the orbit and its contents and exophthalmos resulting from arteriovenous aneurysm.

THERAPY

Prior to the introduction of the sulfonamide drugs as therapeutic agents, the treatment of thrombosis of the cavernous sinus was most unsatisfactory and the prognosis was extremely grave whether medical management or surgical intervention was employed.

Although numerous operations were devised for the treatment of this disease, Eagleton[6] in 1926 succinctly stated the indications for surgical intervention as: (*a*) eradication of the original focus; (*b*) the establishment of as free drainage as possible through the original path of the infection, and (*c*) placing of the inflamed and thrombosed cavernous sinus at rest by ligation of the common or the internal carotid artery. He recognized that radical surgical procedures directed to the cavernous sinus itself had proved unavailing.

After the introduction of sulfanilamide in 1936, and the other sulfonamide compounds later, reports began to appear in the literature of cases in which a much higher incidence of recoveries occurred. Perhaps the earliest case of cavernous sinus thrombosis in the English literature in which sulfanilamide was employed was reported by MacNeal and Cavallo.[8] These authors reported a single case in which a patient with bacteremia and cavernous sinus thrombosis was given sulfanilamide in small doses for only two days, after which she became nauseated and refused the drug. She was then treated with blood transfusions, streptococcic serum and bacteriophage. Though the recovery cannot be attributed to the sulfanilamide, this case is cited to properly accredit the authors. Since this time many reports have appeared in which the sulfonamide drugs were used. In 1941 Lyons[9] reported 2 cases in which sulfonamide compounds were used in combination with the anticoagulant, heparin, with recovery in both instances. Schall,[10] continuing this work, reported 1 case in which sulfathiazole and heparin were employed, with recovery of the patient. In 1943 Lyons[11] reported the successful use of penicillin in combination with sulfathiazole in a case of cavernous sinus thrombosis. Welty[12] subsequently reported a case of thrombosis of the cavernous sinus in a white boy aged 13 in which sulfadiazine, penicillin and heparin were employed, with recovery. Wolfe and Gain[13] mentioned the possibility of using heparin and "dicumarol" in the treatment of the disease but did not employ either drug in the case reported by them. A careful review of the literature by us fails to reveal any report of a case in which "dicumarol" was employed, with or without other agents, so that the use of this drug in 1 of our cases may well represent its earliest use in treatment of this condition.

---

[7] Lederer, F. L.: Disease of the Ear, Nose and Throat, Philadelphia, F. A. Davis Company, 1945.

In view of our present knowledge of thrombophlebitis in general, it is our considered opinion that anticoagulant therapy is of great value in thrombosis of the cavernous sinus and that both heparin and "dicumarol" should be employed in every case. The intravenous administration of heparin produces an almost immediate but fleeting prolongation of the prothrombin time, whereas the oral administration of "dicumarol" produces a delayed but more sustained prolongation of the prothrombin time. The advantage of the quick action of heparin is offset by its costliness and the difficulty of its administration; in contradistinction, "dicumarol" is relatively inexpensive and is given orally. The practical application of these facts leads us to believe that in every case of cavernous sinus thrombosis both heparin and "dicumarol" should be given at once, with heparin being discontinued in twenty-four to forty-eight hours as the "dicumarol" becomes effective and the prothrombin time reaches the desired level. (Compare this with the combined use of regular insulin and protamine zinc insulin in the treatment of diabetes.)

REPORT OF CASES

Case 1.[14]—M. J. H., a white girl aged 8 was readmitted to the hospital on Aug. 4, 1944 because of headache of three days' duration, high temperature and extreme toxicity.

The past history was entirely negative, except for a bilateral chronic otitis media. The patient had recently been advised to have a tonsillectomy and adenoidectomy. On July 21, 1944 these surgical procedures had been carried out with the patient under gas and ether anesthesia. The postoperative course was normal. The child was seen in the outpatient clinic on July 28 and discharged. On August 4 she was brought back to the outpatient clinic in obvious toxemia, with a temperature of 104 F. There was inequality of the pupils, the right one being larger than the left, but both reacted to light. There was some sour-smelling discharge in each ear canal, but no tenderness or edema over either mastoid. The remainder of the physical examination was negative.

Urinalysis was normal except for a trace of albumin. The red blood cell count was 3,170,000; there were 13,550 white blood cells, with polymorphonuclears 92 per cent, lymphocytes 5 per cent and monocytes 3 per cent; the hemoglobin was 66 per cent. The sedimentation rate was 18 mm. (Wintrobe, corrected). The blood sugar level was 188 mg. per hundred cubic centimeters after 1,000 cc. of 5 per cent dextrose solution had been administered intravenously. The nonprotein nitrogen level was 50 mg. per hundred cubic centimeters.

Examination of the spinal fluid revealed a pressure of 130 mm. of water, no cells and 13 mg. of protein per hundred cubic centimeters. A roentgenogram of the chest showed the heart and lungs to be normal. On roentgen examination of the mastoids an undeveloped cell structure was found on either side, with no evidence of destruction of the bone.

About six hours after admission there developed a definite exophthalmos with lateral rectus paralysis on the right side, and the patient became deeply stuporous. A fundal examination revealed essentially normal conditions. In spite of the administration of 1 Gm. of sodium sulfadiazine intravenously every four hours after admission and 50,000 units of penicillin at the first signs of exophthalmos, with 10,000 units every four hours thereafter, the child died at 12:40 a. m. on Aug. 6, 1944. The exophthalmos remained unilateral throughout.

Postmortem examination was refused.

Case 2.—J. F. P., a white man aged 45, was admitted to the hospital on Jan. 9, 1945 at 11:45 p. m. on Dr. Louis Dobihal's service. History revealed a fever of ten days' duration and a swollen right eye of one day's duration. Ten days prior to admission of the patient a pain developed on the right side of the head with fever. A dental consultation revealed that six teeth on the left side were diseased, and these were extracted five days later. Three days before admission a high fever developed, and he was given sulfadiazine. This fever continued, and when the right eye became swollen the patient was hospitalized.

The family history was noncontributory. The past history revealed that in February 1944 the patient had some teeth removed from the left upper jaw; this necessitated scraping the bone and taking some sutures. The day following this he blew his nose and the discharge was bloody with pus. Since then he has frequently had sinusitis.

Physical examination on admission revealed an extremely ill white man with a temperature of 104.8 F. rectally, pulse rate 110, respiratory rate 18, and blood pressure 145 systolic and 90 diastolic. The left eye appeared normal. The right eyelids were decidedly edematous and swollen. There was some purulent discharge present in the conjunctival sac, and there was slight exophthalmos. The conjunctiva was injected. The pupils reacted to light and accommodation and appeared regular. There was pronounced limitation of motion of the eyeballs. Fundal observations were normal. The nasal turbinates were bilaterally swollen and boggy, and there was some free mucopus posteriorly in the right middle meatus. There was definite rigidity of the neck, and the Kernig's sign was positive. There was hyperreflexia on the right, and a positive great toe reflex. The ears were normal, as were the heart, lungs and abdomen. The impression at that time was acute ethmoiditis with orbital extension and meningitis.

[13] Wolfe, W. C., and Gain, J. F.: Thrombosis of the Cavernous Sinus, Arch. Otolaryng. **41:** 79-84 (Jan.) 1945.

[14] Previously reported in the Bull. School Med. Univ. Maryland **29:** 151-153 (Jan.) 1945.

A spinal tap revealed the pressure to be 290 mm. of water. The Queckenstedt sign was negative. There were 5,600 white blood cells, 80 per cent polymorphonuclears, with a 3 plus reaction to the Pandy test. The smear revealed a few cocci of undetermined type, and the culture taken at this time was negative, as were all subsequent cultures. Ten thousand units of penicillin were administered intrathecally at this time, and the dosage was repeated twice a day for eight days. In addition the patient received 15,000 units of penicillin intramuscularly every three hours and 1 Gm. of sulfadiazine orally every four hours. Compresses of boric acid were applied constantly to the region of the right eye.

On admission the urinalysis revealed normal conditions. Examination of the blood disclosed: 57 per cent hemoglobin, 3,470,000 red blood cells, 15,600 white blood cells, 87 per cent polymorphonuclears and 13 per cent lymphocytes. The serologic test of the blood (Kahn) was negative, the nonprotein nitrogen 31 mg. and the blood sugar 120 mg. per hundred cubic centimeters. The sedimentation rate was 30 mm. (Wintrobe, corrected). The blood sulfadiazine level two days after admission was 7.6 mg. per hundred cubic centimeters.

The patient continued to run a septic temperature of 103 to 104 F. rectally for eight days. During this time the patient was delirious and continued unimproved. Intravenous fluids were given twice daily, and on the fifth day a retrobulbar exploration was done on the right eye by another surgeon. Pus was not found, and the same regimen was continued.

On the seventh day when the patient was seen in consultation by us he exhibited pronounced chemosis and injection of the bulbar and palpebral conjunctiva of the right eye. The lids were opened with difficulty because of extreme edema. The right pupil was dilated and fixed, and the fundus revealed dilatation of the veins and extreme narrowing of the arteries with indistinctness of the disk but without definite papilledema. There was decided exophthalmos. Visual acuity could not be determined because the patient was comatose. The nose was free of pus, and there was no tenderness elicted on palpation over the frontal, ethmoid or antral regions. The left eye was unaffected. An impression of cavernous sinus thrombosis was made, and the patient was given 500 cc. of whole blood at once. Sulfadiazine therapy was discontinued, and the intravenous injection of a solution of sulfapyridine sodium 2.5 Gm., twice daily, was begun. Penicillin therapy was continued intramuscularly. The patient began to improve and became responsive and rational on the ninth day but had only light perception in the right eye. The temperature began to drop and by the twelfth day was down to 100 F., rectally; the exophthalmos had begun to recede. The temperature returned to normal on the sixteenth day. The patient could now distinguish objects but could not read with this eye. The fundal picture had returned to normal.

The patient was discharged from the hospital on the thirty-second day and was able to read the smaller headlines of the newspaper. The exophthalmos had almost completely receded. The family physician has since reported that the vision returned to normal after a period of several months and there was no evidence of exophthalmos. Recent inquiry revealed that the patient was living and well without recurrence of the symptoms.

Case 3.—V. H., a white woman aged 31, was admitted to the hospital on the medical service in diabetic coma on Oct. 27, 1945. One week prior to admission the patient had a cold, which was followed by severe frontal headache and profuse nasal discharge. On the evening of admission she became drowsy and could not be aroused; she was brought to the accident room at 9 p. m.

Family and past histories revealed that one brother had died at the age of 42 with diabetes, that the mother had died of pernicious anemia, and that the patient had been known to have diabetes for two and one-half years.

Physical examination on admission revealed that the patient was in coma and had the odor of acetone on her breath. The temperature was 98 F., the pulse rate 132 and the respiratory rate 24. The conjunctivas of both eyes were inflamed, and the lids were somewhat edematous, this being most pronounced on the right side. The eyeballs were soft; the pupils were round, regular, appeared of equal size and reacted sluggishly to light. Ocular motility could not be tested. There was a definite general deviation of the nasal septum to the left. The turbinates were swollen, the mucosa was injected, and there was mucopurulent discharge on both sides. Both ear drums were moderately injected but intact. There was poor oral hygiene and many dental caries. The postpharynx was injected. The remainder of the physical examination revealed essentially normal conditions. The impression at this time was diabetic coma with bilateral antral and ethmoid sinusitis.

On admission the urinalysis showed 4 plus acetone and 4 plus sugar; the blood sugar level was 225 mg. per hundred cubic centimeters. A diabetic regimen was promptly instituted, and the following morning the urine showed a 4 plus sugar, 3 plus acetone and a blood sugar level of 173 mg. The blood contained 68 per cent hemoglobin; 4.35 million red blood cells and 15,600 white blood cells with polymorphonuclears 89 per cent, lymphocytes 3 per cent and monocytes 3 per cent. The serologic (Kahn) test of the blood was 4 plus on two occasions, and the sedimentation rate was 30 mm. (Wintrobe, corrected).

Immediately on admission, compresses of boric acid were constantly applied to the region of the patient's right eye, and 20,000 units of penicillin was administered intramuscularly every three hours. On Oct. 28, 1945 she became responsive but complained of severe pain in the right eye. By October 31 she was unable to open it.

At this time (October 31) there appeared an exophthalmos of the right eye, and ophthalmologic and otolaryngologic consultations were requested. Examination revealed dimness of vision in the right eye with pronounced swelling and inflammation of the lids. The lids were stuck together with a purulent exudate. The conjunctiva was decidedly injected, and the right pupil was larger than the left but reacted to light. There was a definite exophthalmos of the right eye, and ophthalmoscopic examination revealed dilatation of the retinal veins, "boxcar" occlusion of the arteries and haziness of the disk margins. The left eye showed only slight swelling of the lids. The right side of the nose was completely blocked by a purulent, foul-smelling discharge, with much crusting and scabbing high up in the middle meatus. This material was removed, and a large septal perforation was found at the osseocartilaginous junction with dirty, gray, necrotic edges. Examination of the left side of the nose revealed some purulent discharge with a swollen middle turbinate. The throat and ears were normal. The impression at this time was ethmoiditis on the right side, with thrombosis of the cavernous sinus and septal perforation, which was probably syphilitic in origin.

In addition to the 20,000 units of penicillin already being given intramuscularly every three hours, the patient was started on a regimen of 1 Gm. sulfadiazine orally every four hours, and "dicumarol" therapy was instituted. Local nasal medication with 1 per cent ephedrine in isotonic solution of sodium chloride was also begun.

Roentgen examination of the sinuses revealed clouding of both antrums and of the left ethmoid. The frontal sinuses were clear.

The patient continued to be seriously ill. The prothrombin time was kept constantly elevated to 30 seconds (undiluted) by "dicumarol" therapy. Two days later the left eye manifested a definite exophthalmos with venous congestion of the retinal vessels and the pathologic conditions in the right eye had increased in intensity since the previous examination. The patient was given supportive treatment throughout, including transfusions of whole blood.

In spite of this therapy the patient's clinical course was stormy, and bilateral optic atrophy was soon evident. By Nov. 15, 1945 the diabetes was well under control, the temperature was normal and the nasal discharge had almost disappeared. One week later antisyphilitic therapy was begun, using oxophenarsine hydrochloride and a bismuth compound, and the patient's general condition began to improve slightly.

The right eye still exhibited considerable exophthalmos, and *there was no perception of light.*

For the remainder of her stay in the hospital, which totaled seventy-five days, the patient continued her gradual improvement. The exophthalmos completely disappeared on the left side and was minimal on the right. On her discharge the Kahn reaction of the blood was negative and the diabetes was well controlled with insulin and a dietary regimen. She was ambulatory though totally blind in both eyes.

SUMMARY

The use of the terms phlebitis, thrombophlebitis, phlebothrombosis and aseptic thrombosis of the cavernous sinus is discussed and a classification of septic and aseptic thrombosis is presented.

Three cases of cavernous sinus thrombosis are reported, 2 with unilateral involvement and 1 with bilateral involvement, with 2 recoveries.

In the first case the condition was unilateral and was thought to follow adenotonsillectomy. The patient died in spite of the administration of sulfadiazine sodium intravenously and penicillin intramuscularly.

The second case followed dental extraction with probable secondary sinusitis and was complicated by meningitis. The involvement of the cavernous sinus remained unilateral. The patient showed little response to penicillin given intramuscularly and intrathecally and to sulfadiazine taken orally. Intravenous sulfapyridine sodium was substituted for oral sulfadiazine, and the patient showed immediate improvement with ultimate recovery.

The third case was believed to follow a gumma of the nasal septum with secondary infection in a person with uncontrolled diabetes. Treatment consisted of penicillin given intramuscularly and sulfadiazine and "dicumarol" orally. Although the condition became bilateral the patient recovered, but total blindness resulted.

CONCLUSIONS

1. Thrombosis of the cavernous sinus is commoner than is generally supposed.
2. The prognosis is still grave in spite of advances in the use of chemotherapy, anticoagulants and antibiotic agents.
3. The treatment of thrombosis of the cavernous sinus is purely medical, and surgical intervention is only indicated at the site of the origin of the infection to eradicate the focus.
4. The combined use of sulfonamide compounds, antibiotics (penicillin, streptomycin and so forth) and anticoagulants in large doses is strongly advised. If the case is unresponsive to one of the sulfonamide drugs another should be substituted, and the same is probably true of the antibiotic agents.
5. It is our opinion that the early employment of heparin and "dicumarol" administered simultaneously is desirable.

BACILLARY DYSENTERY AS THE CAUSE OF REITER'S SYNDROME

(Arthritis with Nonspecific Urethritis and Conjunctivitis)

RICHARD H. YOUNG, M.D.
Salt Lake City
and
ERNEST G. McEWEN, M.D.
Evanston, Ill.

In December 1916 Reiter[1] in Germany and Fiessinger and Leroy[2] in France independently described the symptom triad of arthritis, conjunctivitis and urethritis. The former ascribed the etiology to a spirochete, the latter to the dysentery bacillus. Perpetuated under the name of Reiter's disease, numerous cases have been described in many articles in the European literature.[3] There are six articles[4] in the American literature, none of which gives serious consideration to dysentery as a cause.

MATERIAL

The study of 176 cases of bacillary dysentery observed in 1943 in Algeria revealed 14 cases of postdysenteric arthritis.[5] Clinical and laboratory summaries of these cases are presented in the accompanying table.

The group includes 1 woman (case 14), 1 Negro man (case 5) and 12 white men. The average age was 27 years. Of these 14 patients, there were only 4 who had arthritis alone (cases 11, 12, 13 and 14). Three patients had only urethritis accompanying the arthritis (cases 8, 9 and 10). Seven patients presented the full triad of arthritis, urethritis and conjunctivitis (cases 1 to 7). In case 2 the patient gave a history decidedly suggestive of conjunctivitis, though no confirmatory observations were available. In all the others objective evidence of the triad was obtained. These 7 instances represent 4 per cent of the total cases of bacillary dysentery and one half of the total cases of postdysenteric arthritis seen in Algeria at this time. There were 5 other cases of possible postdysenteric arthritis, 1 with associated muscular atrophy and peripheral neuritis and 1 with conjunctivitis, but insufficient data are available to justify their inclusion in the present series.

The onset of the arthritis occurred at an average of fifteen days (minimum six, maximum forty-five) after the onset of dysentery. The onset of urethritis occurred at an average of eleven days (minimum four, maximum twenty-five) after the onset of dysentery. Conjunctivitis appeared at an average of twelve days (minimum six, maximum twenty-four) after the onset of the dysentery. It will be seen from the accompanying

Summary of Clinical and Laboratory Data on Fourteen Cases of Postdysenteric Arthritis

Case; Age; Adm. Date	Dysentery	Arthritis	Conjunctivitis	Urethritis	Blood Agglutination; Stool Culture	Sedimentation Rate (Mm./Hr.) W. B. C.	Comment
1. C. M. 23 yrs. 7/16/43	Diarrhea with chills and fever 102 F. 4 wks. prior to admission, 20 stools daily; duration 6 days	Severe; r. ankle 7/10; l. ankle 7/12; l. knee 7/13; aspirated 7/15; 150 cc. turbid straw fluid with 5 leukocytes per high power field; l. metatarsal joints, hips and l. shoulder subsequently involved	Mod. bilateral; velvety purulent discharge 7/14; duration 8 days; smears neg. for gonococcus	Moderate; mucoid discharge 7/16; meatus pouting; smears neg. for gonococcus; erosion lasted 14 days	S. paradysenteriae Y pos. 1:160; S. sonne (7/21) pos. 1:40; stool culture neg.	7/17 40 7/21 103 7/30 107 7/21 W.B.C. 10,100	Uric acid 3 mg./100 cc. 7/21; electrocardiogram neg. Onset: arthritis 24th day, conjunctivitis 24th day and urethritis 25th day; 7/19 brucellergen skin test neg.
2. R. B. 32 yrs. 7/25/43*	Diarrhea with low grade fever, onset 6/14, duration 7 days; no gastrointestinal symptoms on admission	R. elbow 6/24; l. knee 7/2; r. knee and l. ankle subsequently involved	Smarting of eyes noted by patient 6/20; unobserved	Mild; clear mucoid discharge 6/24; 2 days duration; smear neg. for gonococcus	S. paradysenteriae Y pos. 1:160; S. sonne (8/9) pos. 1:40; stool culture neg.	7/26 80 7/31 76 W.B.C. 9,000	Electrocardiogram neg.; uric acid 3 mg./100 cc.; roentgenogram r. elbow and l. knee neg. Onset: arthritis 10th day, conjunctivitis 6th day and urethritis 10th day
3. H. F. 31 yrs. 7/25/43* 7/12/43†	None though many cases in his group; 1 occasion 3 loose stools	R. knee 7/10; l. knee 7/11; proximal interphalangeal joints, l. 2d toe and r. shoulder	Mild; catarrhal 7/6	Mild; clear mucoid discharge 7/12; burning on urination; 3 to 4 days duration	S. paradysenteriae Y pos. 1:320; B. shigae; S. hirschfeldii, S. schottmülleri neg.; S. sonne pos. 1:40; stool culture neg.	7/26 103 W.B.C. 5,000	Uric acid 2.6 mg./100 cc. Onset: arthritis ?, conjunctivitis ? and urethritis ?
4. P. N. 21 yrs. 8/14/43	Severe diarrhea and fever; in bed 5 days 5/30; recurrence 7 days 6/15; recurrence 3 days 7/1	L. elbow 7/11; later l. ankle, l. knee, r. knee, both hips and wrists; 6½ wks. duration; severe	Keratitis severe with erosion l. eye 7/7; corneal infiltration; smears neg. for gonococci; occasional gram-pos. diplococci and gram-pos. and neg. rods; 6 wks. duration	Dysuria and urethral discharge 7/6; smear neg. for gonococci repeatedly; "pleomorphic gram-pos. organisms"; urine neg.; meatus showed superficial ulceration	S. sonne neg. 8/17; S. paradysenteriae Y pos. 1:320; stool culture neg.	8/15 100 8/16 105	Onset: arthritis 11th day, conjunctivitis 7th day and urethritis 6th day
5. A. M. 24 yrs. Negro 5/28/43	Diarrhea, cramping; fever 102 F.; onset 5/27; 3 days duration	L. metatarsal joint; swelling and severe tenderness 6/15	Acute, purulent conjunctivitis 6/16; no gram-neg. diplococci but numerous gram-neg. bacilli; culture neg.	Purulent discharge profuse 6/10; smears repeatedly neg. for gonococci; numerous gram-neg. bacilli; culture neg.	Stool pos. 6/2 for cysts of E. histolytica and course of emetine and carbarsone given; clinical course that of bacillary dysentery; no aggl. done; stool culture neg. 6/19	96 W.B.C. normal	Onset: arthritis 19th day, conjunctivitis 20th day and urethritis 14th day
6. R. C. 21 yrs. 9/23/43* 6/31/43†	Nov. 1942; Jan. 19, 1943; June 25, 1943	R. ankle swollen and hot 6/31; still painful 9/23	Mild 6/31	Cream white discharge 6/31; smear and culture neg. for gonococci; prostatic fluid neg.	S. paradysenteriae Y neg.; stool culture neg.	?	Onset: arthritis 8th day, conjunctivitis 8th day and urethritis 8th day
7. E. H. 27 yrs. 10/28/43	Mild diarrhea (3 stools daily) 9/23 to 9/26	L. 1st metatarsal 10/4; l. knee 10/5; aspirated 140 cc. sterile, yellow mucoid fluid 10/9; r. knee 10/14; r. wrist; little improvement after 3 wks.	Slight sticky discharge 10/6 to 10/10	Grayish discharge 10/5 to 10/16	S. paradysenteriae Y pos. 1:80; stool culture neg.	10/4 96 W.B.C. 13,500	Onset: arthritis 10th day, conjunctivitis 12th day and urethritis 11th day; roentgenogram of l. knee neg.
8. G. A. 24 yrs. 7/16/43	Acute dysentery 6/19 to 6/25; hospitalized	L. knee 6/27; l. shoulder and elbow; severe swelling of the knee; minimal improvement after 35 days	None	Mild, sticky secretion over meatus 7/4; dysuria 4 days duration; urine neg.	Aggl. 7/26; B. shigae pos. 1:320; S. paradysenteriae Y pos. 1:640; S. sonne pos. 1:320; stool culture pos.	7/25 95 W.B.C. 7,750	Uric acid 3.4 mg./100 cc. 7/18 Onset: arthritis 8th day, conjunctivitis none and urethritis 15th day; brucellergen skin test neg.
9. S. C. 38 yrs. 8/21/43* 6/?/43†	Acute dysentery 4 days, May 1943	L. knee 6/15; aspirated yellowish fluid; knee still tender and swollen on admission to hospital; interphalangeal joints of 1st and 2d toes l. foot and all on r. foot	None	Dysuria and cloudy urine 7 days; 2 to 3 days after diarrhea	S. sonne pos. 1:400; S. paradysenteriae Y pos. 1:100; B. shigae neg.	8/21 72 W.B.C. 6,490	Roentgenogram of knee showing "atrophy of disuse" Onset: arthritis 45th day, conjunctivitis none and urethritis 7th day
10. R. S. 25 yrs. 6/7/43	Severe diarrhea, onset 5/24; associated with abdominal cramps and chills of 4 days duration	R. knee 6/2; l. knee 6/4; pronounced hydrops; 150 cc. straw colored fluid, sterile; neg. aggl. studies to Shigella; l. ankle 6/13; pain and tenderness to motion; severe; mod. improvement in 1½ mos.	None	Burning on urination 5/28; few pus cells; moderate urethral discharge	B. shigae neg.; stool culture neg.	6/15 105	Roentgenograms of knees neg. Onset: arthritis 11th day, conjunctivitis none and urethritis 4th day
11. J. C. 22 yrs. 7/13/43	Acute diarrhea 3 days 7/1	Pain, tenderness and swelling of tarsal joints 7/8	None	None	S. paradysenteriae Y neg.; stool culture (7/24) pos. S. paradysenteriae	7/15 88 W.B.C. 16,200	Onset: arthritis 8th day, conjunctivitis none and urethritis none
12. A. A. 27 yrs. 6/26/43	Severe diarrhea with blood; chills and fever 10 days (onset 5/29)	L. hip 6/14; l. knee, l. and r. ankle, l. and r. shoulder	None	None	S. paradysenteriae Y pos. 1:160; S. sonne pos. 1:160	7/2 38	Roentgenogram l. hip neg. Onset: arthritis 16th day; brucellergen skin test neg.
13. C. H. 45 yrs. 6/19/43	Dysentery with fever 5/28	Fluid, pain in l. elbow; both knees and shoulder 6/10	None	None	Stool culture pos. for S. paradysenteriae	....	Uric acid 3.9 mg./100 cc.; peculiar skin lesions on legs; electrocardiogram low voltage on all leads Onset: arthritis 13th day
14. F. T. 34 yrs. Woman 11/7/43	Severe diarrhea with fever 7/27; exacerbation of diarrhea 9/1	Toes, distal and proximal interphalangeal joints; knees 8/18; ankles	......	......	Flexner H, pos. 1:80	Convalescent when seen in hospital	Onset: arthritis 22d day

table that the order of occurrence of the symptoms is variable.

One patient (case 3) experienced only a few loose stools. In 10 cases (1, 2, 5 to 11, 13) the dysentery was classified as mild to moderately severe, and in 3 cases (4, 12 and 14) it was considered severe. The grading of the severity of the dysentery was necessarily subject to large error, but it was our impression that there was little, if any, correlation between the severity of the dysentery and the severity of the complications. Indeed, some of the patients having the severest complications gave a history of mild or only moderately severe dysentery.

The arthritis was polyarticular in all but 2 instances (cases 5 and 6). The average number of joints involved was four. The joints involved, with the frequency of involvement, were as follows: shoulders four, wrists two, left knee three, both knees eight, ankles eleven, hips three, tarsals seven, left elbow three, right elbow one. In the cases of involvement of the knee there was frequently considerable fluid distending the joints. Aspiration was carried out in three cases (1, 7 and 10), and turbid, viscous, yellow fluid was obtained. The fluid in each instance was sterile and in 1 case (10) failed to agglutinate Bacterium shigae antigen (the only antigen available at the time). In this case the blood serum also failed to agglutinate B. shigae antigen.

The conjunctivitis was usually mild. This should be emphasized, for it is easy for both the physician and the patient to overlook it. In case 4, however, a severe keratoconjunctivitis occurred. Repeated examinations of the conjunctival discharges were negative for the gonococcus.

The urethritis was also mild in most of the cases. There were superficial erosions about the urethral meatus in 2 cases (1 and 4). Here again repeated bacteriologic examinations of the discharge were negative for the gonococcus. In 1 instance (case 4) pleomorphic gram-positive organisms were noted.

Stool cultures were positive in 3 cases (8, 11 and 13), negative in 8 and not carried out in 3. Blood agglutination tests were performed in 12 of the 14 cases (omitted in cases 5 and 13). Negative results were obtained in 3 cases (6, 10 and 11). In 2 cases (7 and 14) the tests were positive in titers of only 1:80. In the remainder the tests were positive to one or more strains in titers of 1:160 or higher. The strains involved were as follows: Shigella paradysenteriae Y, 7; Shigella Sonne, 2, and B. shigae, 1. Three cases showed significant positive results to tests with multiple strains.

The sedimentation rate in all cases was decidedly increased, frequently reaching values above 100 mm. per hour by the Westergren method. The white blood cell counts were elevated above 10,000 in only 2 cases (case 7, 13,500; case 11, 16,200).

Roentgen examination of various joints in several of the cases revealed no evidence of articular destruction. Brucellergen skin tests, electrocardiograms and determination of the uric acid content of the blood were also negative or within normal limits.

The course of the arthritis proved to be prolonged, and circumstances required the evacuation of the patients to the United States before we had an opportunity to observe the final outcome. Recurrences over an eight year period have been reported.[8b] Treatment was essentially symptomatic. Large doses of salicylates failed to give adequate relief, and opiates were necessary during the severest phase of the illness. Sulfonamide therapy was without effect. The conjunctivitis and urethritis were usually of brief duration, and in no case were they serious problems.

COMMENT

It is well established that arthritis may be an occasional complication of bacillary dysentery.[6] Noteworthy articles on dysenteric arthritis are those of Graham,[7] Stettner[8] and Klein.[9] The pathogenesis of the arthritic condition is not completely understood. Most observers look on it as an allergic reaction of the articular mucosa to dysenteric toxins.[10] Freiberg[11] has shown that an experimental arthritis simulating the proliferative arthritis of man may be produced in rabbits by the repeated injections of a bacterial extract of S. paradysenteriae Y. He concluded that the dysenteric arthritis of man may be a local allergic manifestation of a bacterial infection in the intestinal tract.

Dysenteric conjunctivitis is also well established as a clinical entity.[12] Voissius, in 1904,[13] in reporting a case of conjunctivitis and iridocyclitis following acute bacillary dysentery, gave an excellent and complete description which covers entirely the syndrome of conjunctivitis, arthritis and urethritis later reported by Reiter. It is of interest that a positive blood agglutination (1:320) for B. shigae was obtained. The reviews of Toulant and Sarrouy[14] and of Kiep[15] are particularly complete. In Reiter's original report[1] it is to be noted that the first entry on the clinical history is that the patient had a "diarrhea with a blood admixture" and that it was eight days later that the urethritis, conjunctivitis and arthritis appeared. No authors have been able to duplicate Reiter's observations in regard to a "spirochete forans." The contemporary (1916) report of Fiessinger and Leroy[2] described the complete symptom triad of Reiter in a discussion of the complications of an epidemic of bacillary dysentery in Somme, France. These authors[2] were the first to use the name conjunctivo-urethro-synovial syndrome.

The tendency in the European literature has been to doubt whether Reiter's disease is a distinct etiologic entity. Schittenhelm and Schlecht[16] and Kruspe,[17] Cimbal[18] and Beiglböck[19] consider Reiter's disease or syndrome secondary to an infection in the intestinal

tract. P. Manson-Bahr[20] commented in discussing Beiglböck's work that "Reiter's disease appears to be nothing else than the familiar dysenteric polyarthritis with some superadded toxic manifestations which have been previously described."

The first report in the American literature was made in 1942 by Bauer and Engleman.[4a] Since that time there have been several other reports.[21] The literature has been completely covered in the reviews of Vallee[3b] and of Lever and Crawford.[3a] The possibility that Reiter's disease might be a complication of an intestinal infection has not been stressed by any American authors.

It seems probable that the symptom triad of Reiter's disease and the "uretero-conjunctivo-synovial syndrome" of Fiessinger and Leroy are the same disease entity. Conjunctivitis and urethritis have often been noted in patients whose disease has been diagnosed as dysenteric arthritis. Our cases 1 to 7 fulfil the clinical requirements of both authors. All 7 patients gave a history of dysentery or diarrhea. Significantly positive agglutination titers for Shigella organisms were obtained in 4 of the 6 cases in which the blood was tested.

CONCLUSION

Reiter's disease in our opinion is a particular combination of three of the recognized complications of bacillary dysentery—arthritis, urethritis and conjunctivitis.

CLINICAL AND PATHOLOGIC STUDIES IN SPRUE

DAVID ADLERSBERG, M.D.
and
JOSEPH SCHEIN, M.D.
New York

This report is concerned with clinical and pathologic observations in a group of 40 patients manifesting the sprue syndrome. These patients were observed at the Mount Sinai Hospital during the past fifteen years.

The central point of this symptom complex is an impairment in the absorption of fat, fat-soluble vitamins and some carbohydrates. As a result, there then may appear steatorrhea; weight loss of considerable degree; an anemia, usually of a hyperchromic macrocytic variety, and painful lesions of the mouth and tongue. Hypocalcemia with tetany and osteoporosis, pigmentation of the skin, hypoproteinemia, polyvalent deficiencies in vitamins, minerals and amino acids, as well as signs of hepatic damage are not infrequently seen.[1]

Of the 40 patients studied, the disease of 36 is designated as "primary sprue," that is, there were no roentgenologic or other evidences of organic changes in the intestinal tract that could account for the syndrome on clinical grounds. In 6 of the 36 patients, postmortem examinations confirmed the absence of gross systemic disease, although alterations were found in the intestinal canal and the mesenteric glands that were considered of interest. In addition 2 other patients died, 1 elsewhere and 1 at this hospital, where permission for autopsy could not be obtained. In 4 others gross pathologic alterations were encountered at necropsy which could be held responsible for the sprue syndrome. This group will be designated as "secondary sprue."

In an effort to see whether patients with the obvious gross changes in the intestinal tract differed in any way from those whose disease was designated as primary sprue, the two groups were separated, and their clinical courses were analyzed and compared.

PRIMARY SPRUE

General Characteristics.—The group with primary sprue comprised 36 patients, 13 men and 23 women (table 1). Of these, 15 were Latin Americans and the rest were first generation Americans of Central and Eastern European extraction. Eighteen were Jewish, 14 Puerto Rican, 1 Cuban, 2 American of Irish extraction and 1 Swedish. The preponderance of Jews and Puerto Ricans in this clinical material can in no way be considered as statistically significant, because this hospital population draws in large part on such groups. The age of the patients ranged from 16 to 73 years, the average being 41. There was only 1 patient each at the extreme ends of the scale.

In view of the differentiation between tropical and nontropical sprue that has been made by many workers in the field, it became of interest to ascertain whether the illness had its inception in the tropical or temperate zones. In this series 7 of the patients contracted their illness either while in the tropics of the Western or Eastern hemisphere, while 29 acquired the disease under our climatic conditions. There were many patients in the latter group who had migrated to the temperate zone, but in whom sprue had developed only after many years' residence here.

Observations of these patients were made over the course of one month to twelve years. The average period was 3.6 years.

Hematologic Observations.—The abnormalities of the hemogram are an essential part of the sprue syndrome (table 2). The hemoglobin values in our patients ranged from 14 to 100 per cent, the average being 62 per cent. Four patients who had a hemoglobin level of 35 per cent or less had bleeding in some form as a prominent feature (cases 7, 9, 20 and 35). The red blood cell counts varied between 0.8 to 5.5 million, the average being 3.0. The two lowest values (0.2 and 0.75) were again found in patients who had bleeding phenomena (cases 7 and 9).

In 19 patients the color index was over 1; in 12 it was 1; in 4 it was less than 1. In the last group bleeding was again a prominent symptom. It may be said, therefore, that 54.3 per cent of the patients manifested a hyperchromic, 34.4 per cent a normochromic and 11.4 per cent a hypochromic type of anemia. Macrocytosis was regularly associated with the hyperchromic and not infrequently with the normochromic group.

The white blood cell counts ranged from 1,950 to 13,900, the average being 6,712. Eight of the patients had 5,000 cells or less, and 6 had 10,000 or more. In 3 of the latter there were febrile rises of undetermined etiology.

In 14 patients the thrombocytes were examined. It was of interest that in as many as 6 they were below 100,000, but in only 1 were there clinical manifestations of bleeding (case 7). In 4 of these 6 patients the icterus index was elevated, and in 3 instances there was evidence of enlargement of the liver and/or spleen.

Examination of the bone marrow was made in 12 instances; in 5 the cells had an erythroblastic character of moderate to pronounced intensity, and in 4 there was a megaloblastosis of similar quality. Two examinations revealed normal conditions in patients in a period of remission. In the other patients, without exception, examinations of the bone marrow were made during the active stage of the disease. In 1 case there was a moderately fatty marrow in a patient near death and with extreme cachexia.

From the Medical Services, the Nutrition Clinic and the Laboratories (Department of Pathology) of Mount Sinai Hospital.

Read before the Section on Gastro-Enterology and Proctology at the Ninety-Fifth Annual Session of the American Medical Association, July 5, 1946.

Because of limitation of available space this article is abbreviated in THE JOURNAL by omission of the illustrations, tables 1, 2, 3, 4 and 6, and considerable portions of the text. The complete article will appear in the authors' reprints.

Stool Findings.—Steatorrhea has been generally accepted as the *conditio sine qua non* of sprue. By this we mean an elevation of the fat in the stool over the upper limit found in normal persons under conditions of the average mixed diet, that is, 15 to 25 per cent of the dried material. In sprue, stool fat-partition reveals only small amounts of neutral fat and large amounts of fatty acids and soaps.

As a rule the feces were bulky, frothy and liquid to semisolid in consistency (table 3). Diarrhea was present almost always. It is our experience that the characteristic sprue stool is not foul-smelling in contrast to that of known inflammatory disease, such as ulcerative colitis and regional ileitis, but rather is rancid in odor. In all the patients but 1 repeated examinations failed to reveal the presence of pathogenic bacteria, ova or parasites in the stool. In 1 patient, a Puerto Rican (case 28), Strongyloides stercoralis was found.

TABLE 5.—*Comparative Data*

	Primary Sprue	*Secondary* Sprue
Number of cases	36	4
Age range	16 to 73	33 to 55
Age average	41	44
Duration of symptoms prior to hospitalization (mos.)	80	4.75
Burning of mouth and tongue	Very frequent	Rare
Soreness and reddening	Frequent	Absent
Clubbing of fingers	Occasional	Occasional
Hemoglobin, percentage	62	74
Red blood cell count (millions)	3.0	3.9
Color index	In 89% 1 or >1	Usually <1
White blood cell count	6,712	10,525
Bone marrow	Erythroblastic or megaloblastic arrest	Normal
Gastric acidity	80% present	Present
Stool findings	Steatorrhea (fatty acids and soaps)	Steatorrhea (fatty acids and soaps)
Serum proteins, Gm./100 cc.	5.8	5.85
Serum calcium, mg./100 cc.	8.1	8.4
Serum phosphorus, mg./100 cc.	3.4	5.1
Phosphatase (alkaline), King-Armstrong units	17.9	?
Dextrose tolerance test—oral	Flat	Flat
Dextrose tolerance test—intravenous	Normal	Normal
Vitamin A blood level	Low	Low
Vitamin A tolerance test	Flat	Flat
Carotene blood levels	Low	Low
Pancreatic enzymes	Present	Present
Liver function	May be impaired	Normal (?)
Therapeutic response		
Hematologic	0 to 4+	No response
Function of bowels	0 to 4+	No response
General	0 to 4+	No response
Roentgenologic observations	Deficiency pattern	Deficiency pattern

However, there do exist patients presenting the typical sprue syndrome who have only one or two formed bowel movements a day, even at the height of their disease. These stools may nevertheless have a high fat content, as in cases 15 (32.5 per cent) and 23 (46 per cent).

In 18 instances the total fat content in percentage of dried weight averaged 38 per cent. In 4 other patients an analysis of the fat, made while the patient was on a fat-restricted diet revealed an average of 14.7 per cent. The great difference in these two values emphasizes the importance of the fat content in the diet at the time when the determinations are performed. Such low figures do not impair the validity of the diagnosis of steatorrhea under conditions of greatly limited fat intake.

The 4 patients (cases 11, 15, 23 and 24) who had formed stools at the onset showed some clinical features in common. All 4 undoubtedly had sprue. With 1 exception (case 24) hydrochloric acid was present in the stomach. Two patients (cases 11 and 14) had hemorrhagic manifestations, while in the remaining 2 thrombopenia was present (cases 25 and 23), in the former with jaundice. The significance of these observations, which may be purely coincidental, cannot be evaluated at the present writing.

Characteristically, the stool of sprue is free of blood, both gross and occult. This was borne out in all except 5 instances, in 4 of which there were severe manifestations of the hemorrhagic diathesis. The fifth patient (case 2) died with renal failure (azotemia).

Chemical Studies.—The chemical studies included determination of total serum proteins, the albumin-globulin ratio, the calcium, phosphorus and phosphatase content, as well as the pancreatic enzymes in the duodenal contents. Dextrose tolerance tests were performed orally and intravenously. Fat or vitamin A tolerance tests were performed in the standard way. To evaluate the function of the liver, icterus index, total and esterified cholesterol, the prothrombin time and in a few instances hippuric acid synthesis, galactose tolerance and cephalin flocculation tests were done.

Vitamin A and Fat Tolerance Test.—In 17 patients the ability to absorb fat and/or fat-soluble vitamins was tested using cream and vitamin A, respectively (table 4). In 2 (cases 22 and 24) the absorption of the fat was decidedly impaired, the fasting and postprandial level of the total serum lipids being almost identical. Similar observations were made with vitamin A in 15 patients. In 12, during the active stages of the disease the fasting vitamin A level ranged between 15 and 63 micrograms, the average being 35 micrograms per hundred cubic centimeters. This represented a reduction of about 50 per cent when compared with that found in the average hospital population. The maximum elevation of the vitamin A serum content four hours after the administration of 180,000 international units varied between 28 and 85 micrograms, the average being 44.3 micrograms per hundred cubic centimeters.

Therefore, the disturbance in vitamin A metabolism in sprue is characterized by low fasting figures and lack of elevation in the postabsorptive phase.[3] A similar situation exists with regard to the carotene levels of the serum. The values are extremely low during the phases of the active disease. Even during remission the disturbed pattern in vitamin A and carotene metabolism may persist, although in a modified form. Three patients (cases 9, 16 and 23) examined at such a time showed average fasting levels of 61.6 micrograms per hundred cubic centimeters, with a postprandial elevation averaging 80 micrograms. In other instances in which it was possible to make serial studies during the period of observation slight improvement or none at all was observed. Although the fasting values rose considerably in 3 patients (cases 33, 35 and 36) there was no improvement noted in their absorptive capacity. However, patient 31 failed to show a change of the fasting or postabsorptive levels. This is all the more remarkable in the face of the improvement in the general condition, the diarrhea and the hematic picture. Any analogy may be drawn, possibly, between this observation, the persistent steatorrhea and the maintained roentgenologic abnormalities of the small bowel seen in some patients during periods of remission.

Response to Therapy.—It is well established that sprue is amenable to specific therapy. This consisted in these patients of a high protein and low fat diet with moderate amounts of carbohydrates, preferably in the form of monosaccharides." The diet was supplemented by large amounts of vitamins, especially of the B complex, parenteral extract of liver and, of late, folic acid.[4]

A classification based on a 1 plus to 4 plus change in the reticulocytes, hemoglobin and red blood cells disclosed that 6 patients had a 4 plus response, 14 a 3 plus response and 9 a 1 plus response to therapy. One patient died of undetermined cause with no response at all (case 2). In addition, it must be stated that fatalities occurred even in those patients with good original responses of 1 to 3 plus.

---

[3] Adlersberg, D., and Sobotka, H.: Fat and Vitamin A Absorption in Sprue and Jejunoileitis, Gastroenterology **1**: 357, 1943. Adlersberg, D.: Fat and Vitamin A Absorption in Sprue, New York State J. Med. **44**: 606, 1944.

In the clinical course of the successfully treated patients there was a remarkable improvement in bowel function with a subsidence of diarrheal movements concomitant with improvement of the general condition and the hematic picture. Analyses of the stool revealed likewise a diminished fat content in some instances, for example, cases 4 (47 to 27 per cent), 5 (40 to 13 per cent) and 22 (55 to 25 per cent), while in others the fat content of the formed infrequent "normal" stool may remain high, e. g., case 36 (55 to 34 per cent). These latter instances may thus resemble conditions in a group of sprue patients who never consult the physician with a complaint of diarrhea.

A similar classification on a 1 plus to 4 plus basis with regard to the amelioration of the bowel function disclosed that 27 of the 36 patients had an improvement of 2 to 4 plus. In all of them the frequency of diarrhea diminished considerably, and in those with a 4 plus response a formed stool was achieved; but even in the latter bowel disturbances frequently could not be avoided when the intake of fat was increased. There were 4 patients in the group having sprue without diarrhea (cases 11, 15, 23 and 24), so that one could not anticipate any change in them. Four patients (cases 32, 33, 35 and 40), of which 1 (case 40) was treated with folic acid, failed to show improvement in this regard. In this group 3 patients represented the therapy-resistant type of sprue, since they did not respond well in any respect, while 1 did show hematologic progress after liver therapy and blood transfusions. In 1 patient who died no adequate observations were available.

Although the initial hematologic response was relatively not so striking as the coprologic response, nevertheless in long range terms of return to normalcy, the elevation of the blood count superseded the intestinal improvement. This was so because a 4 plus stool response still carried with it the ever present tendency to looseness of the bowels under certain circumstances, such as emotional stress, intercurrent infection and high fat content of the diet.

As far as the effect on the roentgenologic findings was concerned, it was found that in the course of successful therapy the disturbed motility as well as the deficiency pattern of the small intestine may revert to normal or at least improve considerably. Nevertheless, no set rule can be laid down, since in other instances an abnormal pattern may persist despite improvement in the general condition and the bowel function of the patient.

Taken all in all, including gain in weight, sense of well-being, and alleviation of glossitis, 27 patients showed a remarkable response to specific therapy, 6 a moderate improvement and 3 none at all. This entire group included 8 fatalities, in some of whom the early response to therapy was favorable. Of these, 6 came to necropsy.

SECONDARY SPRUE

In this series there were 4 patients (cases 14, 21, 28 and 34) with secondary sprue, of whom 2 were men and 2 women. Only 1 was a Latin American (Puerto Rican); 2 were Jewish of Central European extraction and 1 was American of Irish origin. Their ages ranged from 33 to 55 and averaged 44.

The duration of symptoms prior to the need for hospitalization ranged from three to six months, averaging 4.75 months (table 1). As in primary sprue, these patients were underweight, the average being 104 pounds (47 Kg.) weight on admission and 102 pounds (46 Kg.) on discharge. The net loss of weight was 2 pounds (1 Kg.). With the exception of 1 patient (case 14), who gained 5 pounds (2.3 Kg.) transiently, all lost weight.

Atrophy of the tongue was encountered 3 times, cheilosis twice in this group. Burning of the mouth was present only once. Striking soreness of the mouth with fiery reddening was not observed. In only 1 of these patients (case 21) was unequivocal pigmentation of the skin present. Clubbing of the fingers was observed in only 1 patient (case 14), and this was of a mild degree.

Hematologic Data.—The hemoglobin ranged from 60 to 95 per cent, the average being 74 per cent (table 2). The red blood cell count varied from 3.4 to 4.4 million, the average being 3.9 million. An analysis of the color indexes disclosed that 1 patient was normochromic and 3 were hypochromic. In none of these patients was macrocytosis present. The white blood cell count ranged from 6,500 to 12,700 and averaged 10,500. Febrile rises were present in 2 patients (cases 21 and 28). No observations on blood platelets were made. No bleeding phenomena were observed in any of the patients of this group. The bone marrow was normal in 3 instances and hypoplastic in 1.

Stool.—All 4 patients had light colored, fatty, foamy, bulky stools whose consistency varied from a liquid to a semisolid state. They were indistinguishable from the stools of sprue in every respect. In only 1 instance (case 14) was quantitative analysis for total fat made, and this proved to be 47 per cent of the dried weight. In 3 of the 4 patients occult blood was found regularly (table 3).

Roentgenologic Observations.—In all these cases roentgenologic study revealed abnormalities of the small intestine resembling the deficiency pattern seen in sprue. In patient 14 there was in addition a type of serration of the small intestinal loops which did not exclude the diagnostic possibility of an ulcerative process.

Response to Therapy.—The response to therapy in these patients, of whom only 3 received liver parenterally, was uniformly poor. Indeed, all 4 of them died. In only 1 patient (case 34) was there improvement in the quality of the stools, but only transient amelioration of the blood picture.

POSTMORTEM FINDINGS

Of the 12 patients who eventually died of sprue, 10 came to necropsy. Of these, 6 had primary sprue (cases 1, 7, 29, 30, 31 and 35) and 4 (cases 14, 21, 28 and 34) had secondary sprue. The essential clinical data of the 10 patients are available in tables 1, 2, 3, 4 and 6, the pathologic findings are summarized in table 7.

PRIMARY SPRUE

Of the 6 patients with primary sprue, patient 1 died after an appendectomy for acute appendicitis and patient 31, twenty-five days after resection of the sigmoid colon for volvulus, with subsequent purulent pyelonephritis. Patient 35 succumbed with great rapidity to an acute necrotizing laryngotracheitis, from which an atypical type B influenza virus was recovered. Patients 7 and 29 died of a tetanic and hemorrhagic syndrome, associated in the latter with necrosis of the liver. Patient 30 died of a progressive cachexia terminating in marantic thromboses of the dural sinuses and cerebral veins.

Small Intestine.—Although the small intestine was grossly described as being normal in patient 1, unfortunately no record of histologic examination or tissue for restudy could be obtained. Patient 7 showed, as the most striking abnormality, large amounts of a granular pigment identified as hemofuscin (fig. 1). This was found only within the sarcoplasm of the cells comprising the muscularis propria and was present in greater amounts proximally than distally. Similar findings, but to such a degree that it could be appreciated grossly as a brownish discoloration of the muscularis, were present in patient 31 (fig. 2). In this instance there was likewise a considerable paucity and separation of the cells of the muscular tunic.

The small intestine of patient 30 presented *nothing grossly* or microscopically of significance pertaining to the sprue syndrome from which she had suffered for many years. Two small chondromas of the proximal jejunum were found and a few nonconspicuous fibrous adhesions which stemmed most probably from the previous operation. In both patients 29 and 35 the small intestine appeared normal grossly, although in the former the examination with a hand lens revealed scattered foci where the mucosal surfaces appeared more velvety than normal. On microscopic study remarkable lesions consisting of hyaline bands and deformities of the villus such as clubbing were *found in all* portions of the small intestine (fig. 3). These *lesions have* received detailed study elsewhere [5] by one of us (J. S.). Except for an increase over the expected number of leukocytes in the lamina propria and occasional bizarre villus shapes, no morphologic abnormalities were encountered in patient 35.

TABLE 7.—*Summary of*

Case	Stomach	Small Intestine	Large Intestine	Mesenteric Lymph Node	Pancreas	Liver
Primary sprue						
1	Gross: atrophy	Normal	*Normal*	Normal	Normal	1,920 Gm.
	Micro.: atrophy	No info.	Normal	*No info.*	Normal	Centrolobular fibrosis; fat moderate
7	Gross: flat, pale	*Congestion*	Congestion	Enlarged	Normal	1,240 Gm.
	Micro.: within normal *limits*	Marked hemofuscinosis of muscularis propria	Mild hemofuscinosis	Within normal limits	Interlobular *fibrosis, moderate*	Congestion
29	Gross: normal	Normal, "velvety mucosa"	Normal	Enlarged	Normal	1,100 Gm.
	Micro.: slight atrophy of pyloric mucosa	Villus clubbing with hyaline villus bands	Much mucus	Chronic lymph*adenitis* *	Some acinar atrophy	"Acute yellow atrophy"
30	Gross: atrophy	Normal	Normal	*Normal*	Enlarged	2,080 Gm.
	Micro.: autolysis, small myoma	Normal except for 2 serosal chondromas and some fibrous adhesions	*Normal*	Normal	Fine fibrosis	Extreme steatosis
31	Gross: massive dilatation	Massive dilatation; brownish pigmentation *of the muscularis*	Normal except for brownish pigmentation of the muscularis	Enlarged	Normal	1,875 Gm.
	Micro.: hemofuscin in muscle	Hemofuscinosis of the muscularis propria; atrophy of the muscularis	Hemofuscinosis of *the muscularis propria*	Unusual, disproportionate trabeculation	Severe interlobular and intralobular fibrosis	Congestion
35	Gross: normal	Normal	Normal	*Enlarged*	Normal	1,580 Gm.
	Micro.: normal	Increased leukocytes in lamina propria; occasional bizarre villus shapes	*Endometriosis, focal*	Unusual, disproportionate trabeculation	Intralobular fibrosis	Normal
Secondary sprue						
14	Gross: ulcerated lymphosarcoma	Lymphosa; involvement with jejunojejunal and multiple ileal fistulas; entire thickness of bowel involved	*Normal*	Enlarged nodes (tumor)	Normal	1,440 Gm.
	Micro.: lymphosa; with ulceration	....	Normal	Enlarged nodes; *pigment*	Normal	Congestion; tumor
21	Gross: normal	Normal	Normal	Normal	Some fat necrosis	2,600 Gm.
	Micro.: amyloid, with some adjacent round cell foci	Extensive amyloid deposition in stratum proprium, basement membrane and vessels of submucosa	Small infrequent *foci of acute proctocolitis*	Foci of acute lymphadenitis	Moderate interlobular fibrosis	Extensive amyloid deposition with liver cell atrophy
28	Gross: normal	*Normal*	One ulceration	Enlarged, firm	Normal	1,340 Gm.; atrophy
	Micro.: normal	Villus and submucosal collection of lipoid-containing macrophages	*Normal otherwise*	Granulomatous giant cell reaction with lipoid-containing macrophages	Normal	Miliary tuberculosis
34	Gross: diffuse congestion	Smooth, pale mucosa with thin wall	*Severe congestion,* some erosions	Atrophy	Normal	1,400 Gm. (enlarged for this patient)
	Micro.: normal	Amyloid deposition in stratum proprium and vessels	*Normal*	Atrophy	Slight diffuse fibrosis	Focal congestion

* This diagnosis was made on a node biopsied during an exploratory laparotomy three months after the onset of illness.

Mesenteric Lymph Nodes.—The mesenteric lymph nodes which lie astride the absorption pathways of the small intestine deserve careful consideration in any case of malabsorption. No information was available in patient 1, although there were presumably no gross changes. Patients 7 and 30 revealed no significant findings in contrast to patients 29, 31 and 35 in whom the nodes were enlarged to at least twice the normal size. A mild chronic lymphadenitis was present in patient 29. The nodes in both patients 21 (fig. 4) and 35 (fig. 5) were characterized by an unusual broad fibrous trabeculation, whose counterpart was not seen in sections of our control group of 40 other mesenteric lymph nodes from cases of all types (fig. 6).

Spleen.—A splenomegaly of mild degree was present in patients 1 and 35 (490 and 300 Gm., respectively). In the former there were associated congestive hepatic changes and terminal infection. In the latter the morphologic alterations could be ascribed to the old operative intervention for a left subdiaphragmatic abscess and to the fulminating respiratory infection at the end.

Findings at Necropsy

Spleen	Bone Marrow	Adrenals	Parathyroid	Skin	Comment
490 Gm.	Spongy, red	Normal	No info.	No info.	Cause of death: appendicitis
Hyperemia; fibrosis; "acute splenitis"	Erythroid hyperplasia	Normal			
150 Gm. (enlarged)	Spongy, red	Normal	Normal	Normal	Cause of death: multiple hemorrhages
Hyperemia; lining endothelial hyperplasia	Decided erythroid hyperplasia	Normal	Normal	Iron free pigmentation, basal layer	Deformed dwarf
210 Gm.	Spongy, red	Normal	Normal	Pigmentation; follicular hyperkeratosis	Cause of death: liver necrosis and multiple hemorrhages
"Acute splenitis"	Increased fat, paucity of megakaryocytes; erythroid activity good	Normal	Congestion and hemorrhages	Melanin	
75 Gm.	Normal	Normal	Normal	Normal	Cause of death: marantic thrombosis of dural sinus and cerebral veins
Fibrosis; hemosiderosis	Increased fat with pronounced erythroid activity	Normal	Conspicuous connective tissue proliferation	....	General atrophy of viscera except liver and pancreas
190 Gm.	Spongy, red	Autolysis	Normal	Pigmentation	Cause of death: volvulus of the sigmoid with resection; and acute purulent pyelonephritis
"Acute splenitis"	Active myeloid and erythroid series	Autolysis	....	Melanin; hemosiderosis, slight	Hemofuscinosis; old "neurodermatitis" and brawny edema of the legs
300 Gm.	Spongy, red	Normal	Normal	Normal	Cause of death: acute necrotizing laryngotracheitis (influenza virus B)
Fibrosis and "acute splenitis"	Increased fat; increased erythroid activity	Autolysis	Normal	....	Status 1 yr. after drainage of left subphrenic abscess
175 Gm.	Spongy, red	Normal	No info.	No info.	Cause of death: intestinal obstruction
Congestion	Active in all series	Reticularis heavily pigmented	....	....	Abdominal lymphosarcomatosis; chronic adhesive peritonitis; general pigmentation, not intestinal; pigmentation in lymph nodes, testes and seminal vesicles
250 Gm.	Spongy, red	Normal	No info.	Diffuse pronounced pigmentation	Cause of death: hypernephroma
Extensive amyloid deposition	Normal except for amyloid	Amyloid deposition	....	Melanin in basal layers	Generalized amyloidosis; azotemia; biliary calculus
120 Gm.	Negative	Lipoid-poor	Normal	No info.	Cause of death: disseminated tuberculosis
Miliary tuberculosis hemosiderosis	General hypoplasia	Fresh tubercle; fat atrophy	....	....	Intestinal lipodystrophy (Whipple's disease)
Surgically removed 14 yrs. before	Spongy, red	Lipoid-poor	Normal	Pigmentation (focal)	Cause of death: Hodgkin's disease
....	Normal; active erythroid series	Normal	Normal	Melanin	Amyloidosis of heart and small intestines; status 8 yrs. after radio therapy; biliary calculi

Liver.—Although patient 1 had a hepatomegaly (1,920 Gm.) with fatty changes and a centrolobular fibrosis of moderate degree and patient 31 a slight hepatic enlargement (1,875 Gm.) due principally to congestion, these alterations were not nearly so striking as those observed in patients 29 and 30. The former had a severe necrosis of the liver and the latter a steatosis of such a degree that liver parenchyma was not visible in many of the fields. Patients 7 and 35 had no anatomic abnormalities.

The 150 Gm. spleen of patient 7, a female dwarf, represented a mild splenomegaly due to systemic hemorrhage, in part, and to sinus hyperplasia of undetermined origin. In both patients 29 (210 Gm.) and 31 (190 Gm.) the small increase was due to the reaction from systemic hemorrhages and infection, respectively. In patient 30 there was diminution in the size of the spleen (75 Gm.) associated with general visceral atrophy, the exceptions having previously been noted. Histologically, fibrosis and a moderate degree of hemosiderosis were observed.

SECONDARY SPRUE

Of the 4 patients with secondary sprue, patient 14 died in a bout of small intestinal obstruction subsequent to lymphosarcoma. Patient 21 succumbed to the combined effects of a malignant renal tumor (hypernephroma) and generalized amyloid disease with resultant renal insufficiency. The course of patient 28 was terminated by a fulminating widespread miliary tuberculosis, while patient 34 wasted away gradually because of the underlying primary condition, Hodgkin's granuloma, which preceded her amyloid disease.

Small Intestine.—Almost no portion of the small bowel was spared by lymphosarcoma in patient 14. The mucosa and all the components of the bowel wall were involved, with multiple fistulous tract formation in the jejunum and the ileum. The lumen itself was not compromised anywhere. The gross appearances, except for some thinning of the bowel wall in patients 21, 28 and 34, were essentially those of normal small intestinal tracts. Histologically, however, a different picture was obtained. Patient 21 showed extensive deposition of amyloid material lying along the basement membrane at the absorbing surface, clumps of amyloid in the reticular framework of the villus and involvement of the vessel walls, especially of the submucosa (fig. 7). A similar picture in which, however, the submucosal vessels were relatively more involved was presented by patient 34 (fig. 8). Patient 28 showed the classic features of intestinal lipodystrophy (Whipple's disease). Despite the severest autolytic change, "sections of small intestine showed almost confluent collections of lipoid containing uninucleated cells . . . which virtually replaced the normal contents of the villi . . . down to the muscularis mucosae."[4]

Mesenteric Lymph Nodes.—In patient 14 there was massive involvement of the mesenteric glands by tumor tissue to such a degree that absorption was most likely mechanically impaired. A similar massive involvement was present in patient 28, due this time to nodes which appeared grossly "yellowish and homogeneous," and microscopically showed granulomatous giant cell reaction with many lipoid-containing macrophages.

In decided contrast to the 2 cases just mentioned, the mesenteric glands of patients 21 and 34 revealed no lesions capable of causing interference with intestinal resorption. Except for an incidental focus of acute inflammation in one of the nodes of patient 21, there were no abnormalities. Patient 34 had nodes that were not even of normal size, while histologically they showed merely a severe depletion of the lymphoid elements.

Liver.—A hepatomegaly of considerable proportions was present only in patient 21 (2,600 Gm.), secondary to extensive deposition of amyloid material. Subsequent hepatic cellular compression was present. The enlargement of the liver in patient 34 could be accounted for by congestion. The organs of patients 14 and 28 were not remarkable in themselves and showed focal evidence of lymphosarcoma and recent tuberculosis, respectively.

Spleen.—The moderate splenomegaly (250 Gm.) which existed in patient 21 could be accounted for by amyloidosis. There were no changes which might perhaps be significant for the sprue syndrome in patients 21 and 28. The spleen of patient 34 had been removed surgically fourteen years previously for hemolytic icterus.

COMMENT

The foregoing analysis of primary and secondary sprue is incomplete in many respects. The group having primary sprue comprises 36 patients, the group with secondary sprue only 4. The available data permit delineation of primary and secondary sprue. While there are some similarities, the prevailing dissimilarity may be used for differential diagnosis (table 5). The age range is almost identical in both groups, the averages being 41 and 44 years.

There is a striking difference in the average duration of the disease before hospitalization became necessary: 80 months in primary and 4.75 months in secondary sprue. In other words, the average patient with primary sprue had been suffering from the symptoms of the disease for many years before hospitalization became necessary because this disease, like most of the other nutritional disorder, is characterized by spontaneous remission and exacerbations, not infrequently on a seasonal basis. In contradistinction, the organic disease associated with secondary sprue showed in all patients a rapidly progressive course with eventual fatal outcome and thus required hospitalization after a comparatively short period of four to five months. Considerable loss of weight was a feature that both groups had in common.

While lesions of the mouth and tongue were outstanding clinical signs in primary sprue they seemed to be of minor importance in secondary sprue. Burning and soreness of the mouth and tongue, which interfered seriously with alimentation in primary sprue, were only an occasional minor complaint in secondary sprue.

Clubbing of the fingers was infrequent both in primary and in secondary sprue. Its cause in primary sprue was obscure. It was nonetheless obscure in 1 instance of secondary sprue (case 14), in which there was massive involvement of the intestine by lymphosarcoma. Such clubbing is not infrequently seen in other conditions associated with equally severe lesions of other types, that is, ulcerative colitis.

The hematologic observations differed considerably in the two groups. Although secondary sprue was characterized by more or less serious organic disease, the hemoglobin and erythrocytes were on a higher level than in primary sprue: hemoglobin 62 and 74 per cent, and erythrocytes 3.0 and 3.9 million, respectively. The color index definitely is of differential diagnostic aid. In 89 per cent of the cases of primary sprue the color index was 1 or less than 1. In secondary sprue it was invariably less than 1. In other words, a persistently low color index in the absence of bleeding phenomena together with obvious iron deficiency in a case of sprue syndrome should be considered highly suspicious of secondary sprue. The leukocyte cell count averaged 6,712 in primary and 10,525 in secondary sprue. The severe case of primary sprue usually showed leukopenia in association with macrocytic hyperchromic anemia. In contrast secondary sprue showed a tendency to moderate leukocytosis in association with mild hypochromic anemia. In the graver manifestation of the disease, primary sprue was characterized by low platelet counts, low prothrombin levels and evidences of general bleeding, while secondary sprue showed absence of the last mentioned. The bone marrow in the active stages of the disease was characteristically erythroblastic or megaloblastic in primary and essentially normal in secondary sprue.

The findings in the varied studies of gastrointestinal function were similar in both groups. Presence of free hydrochloric acid was encountered almost regularly in both groups. The type of diarrhea and steatorrhea was similar in both groups. Frequent, bulky, frothy, loose to semisolid stools containing only small amounts of neutral fat and an abundance of fatty acids and soaps were observed. The average fat content of the dried fecal material was 38 per cent in primary sprue; a quantitative fat analysis was performed in only 1 case of secondary sprue and proved to be 47 per cent.

---

[4] We are indebted for the postmortem findings in this case to the Department of Pathology, Johns Hopkins Hospital, Baltimore.

There was no noteworthy difference in the roentgenologic observations. In both groups disturbed motility and alteration of the pattern (deficiency pattern) were the characteristic features. Only in 1 case of secondary sprue (case 14) were there peculiar areas of constriction and serration suggestive of a different type of intestinal involvement. Thus, careful roentgenologic studies may prove in some instances to be of great help in revealing the underlying intestinal disease in cases of secondary sprue.

The chemical analysis of the blood failed to reveal any characteristic differences between the two groups. The blood protein levels were low normal in both (5.8 and 5.85 Gm. per hundred cubic centimeters). Pronounced hypoproteinemia was a rare finding in some of the most serious cases of primary sprue. The absence of decided hypoproteinemia in secondary sprue is not significant in view of the small number of cases observed.

The calcium content of the serum was low in both groups, 8.1 and 8.4 mg. per hundred cubic centimeters, and manifestations of tetany were observed. Thus, the presence or absence of tetany is not of differential diagnostic importance. The serum phosphorus tended to be low in some instances of primary sprue, the average being 3.4 mg. per hundred cubic centimeters. The corresponding figure in secondary sprue was 5.1 mg. While elevation of the alkaline serum phosphatase was frequent in primary sprue (average 17.9 King-Armstrong units) and was associated with osteoporosis, no corresponding determinations were available in secondary sprue.

The dextrose tolerance tests presented typically flat curves in both groups, while the blood sugar curves after intravenous administration of the sugar showed as a rule the normal elevation and decrease of the blood sugar level.

The alterations of the vitamin A metabolism were also identical in both groups: extremely low levels of both vitamin A and carotene in the blood and lack of a postprandial elevation of the vitamin A level in the vitamin A tolerance test. The carotene concentration of the blood was strikingly low in both groups. Pancreatic enzymes were found to be present in the duodenal content in primary and secondary sprue.

In some instances of primary sprue enlargement of the liver and impaired hepatic function were found; other observations included mild icterus, low levels of blood cholesterol and cholesterol esters and impairment of hippuric acid synthesis. While corresponding determinations were not performed in secondary sprue, none of the patients had icterus or any clinical evidence of hepatic dysfunction.

The therapeutic response was certainly of diagnostic importance. With few exceptions there was a definite improvement of the hematic picture and the bowel function in primary sprue, while the progressive course and fatal termination of secondary sprue could not be influenced by therapy.

Thus, the clinical differentiation of primary versus secondary sprue was possible on the basis of differences in the history and duration of symptoms, the presence of typical oral lesions, the different hematologic findings and the response to specific therapy.

Analysis of the pathologic data in primary and secondary sprue offers an explanation for some differences in the clinical picture. Many other problems remain obscure and require careful additional study. The relatively short history and duration of symptoms in secondary sprue becomes understandable. The underlying morbid process leads to a rapid fatal termination. In contrast, primary sprue is a chronic disease with periods of remission and relapse. The typical oral and lingual lesions of primary sprue apparently require many months or years for their full development and are therefore only of minor importance in secondary sprue. They must be considered in the light of our present knowledge as evidence of nutritional deficiency, for instance, of factors of the vitamin B complex (nicotinic acid, riboflavin, folic acid and possibly other factors as well). This deficiency plays only a minor role in the short "life history" of secondary sprue.

The hematologic differences in both groups may be similarly explained. Primary sprue is characterized by a macrocytic, hyperchromic anemia with erythroblastic and/or megaloblastic arrest of the bone marrow and thus resembles other macrocytic anemias (addisonian anemia, macrocytic nutritional anemia, and the like). On the other hand, secondary sprue presents a hypochromic type of anemia with a normal bone marrow as usually seen in wasting disease. The therapeutic response in primary sprue is based on replacement of the deficient nutritional factors by the administration of extract of liver or folic acid. While the majority of cases of primary sprue show a dramatic therapeutic result, no response can be expected in secondary sprue, which is not of nutritional origin.

The pathologic findings in sprue will be discussed only briefly. Striking anatomic alterations are not commonly observed in primary sprue of either the tropical or nontropical variety. What findings there are consist chiefly in atrophy.[5] It is therefore noteworthy that in all but patient 1 (on whom there were no sections of the small intestine) a relatively uncommon lesion was present (table 7).

Hemofuscinosis of the muscularis propria of the gastrointestinal tract was present in 2 patients (cases 7 and 31). The significance of these findings is not completely clear, but it may well be related to the "ceroid" pigment, as described by Pappenheimer and Victor[7] in animals deficient in vitamin E and in man with malabsorption syndromes. It is well known that in sprue there is malabsorption of all fat-soluble vitamins. These patients present evidence of deficiency of vitamin A (clinical changes and chemical evidence), vitamin D (osseous changes and abnormalities of calcium metabolism) and vitamin K (bleeding and hypoprothrombinemia). Hypovitaminosis E might well round out the picture. Whether some of the changes in pigmentation may be accounted for by vitamin E deficiency is conjectural at present.

The lesion in the small intestine of patient 29, consisting of villus deformities with stromal hyaline band formation and subsequent vascular distortion, has been described in greater detail elsewhere.[5] The implications of such a lesion for the disturbance in the transport of nutrients across the intestinal membrane is obvious, especially in view of its widespread character.

The hyaline lesions occur predominantly at the villus tips which are notoriously susceptible to autolysis or inadvertent trauma in the routine examination of the intestine. Therefore, the possibility exists that more cases of primary sprue handled with the necessary precautions at the postmortem table may present similar findings. In view of the relatively delicate histologic character of this lesion, it was deemed advisable to retain this case in the group of primary sprue. However, the impression is gained that such a case might be included with justification in the group of secondary sprue.

[7] Pappenheimer, A. M., and Victor, J.: "Ceroid" Pigment in Human Tissues, Am. J. Path. 22: 395, 1946.

In this material there certainly seem to be no characteristic changes of the large bowel in sprue. The mesenteric lymph nodes which lie astride the absorption pathways of the small intestine deserve careful consideration. The chronic mesenteric lymphadenitis as found in patient 29 may be related to a chronic process of which the intestinal lesions were the end result. The unusual disproportionate trabeculation of the mesenteric glands in patients 31 and 35 cannot be evaluated at present. The absence of such a lesion in a preliminary control series of 40 mesenteric nodes is suggestive that these observations, whose counterpart was not found elsewhere, may have some significance in the pathogenesis in these 2 cases. This, however, must await further study.

In view of the importance of the pancreas in the digestion of fat, the results of examinations of this gland deserve comment. No apparent reason, such as cholelithiasis, could account for the various degrees of fibrosis observed. This is in contrast to the 2 instances (cases 21 and 34) of secondary sprue, in which similar lesions could be attributed to coexisting calculous cholecystitis. There was no evidence during the lifetime of either patient of any disturbance in the external pancreatic secretion in sprue.

The role of the liver has naturally been the subject of discussion in a disease so frequently associated with a macrocytic hyperchromic anemia.[1b] The centrolobular fibrosis which is the result of chronic congestive phenomena is in itself not the cause of any serious functional derangement of the liver. The hepatic necrosis (patient 29) occurred as a unique complication in a person suffering from the chronic malnutrition of sprue. Steatosis of the liver is certainly not a characteristic lesion, since it may be found in many other disease states. Its extent in patient 30 was striking. One may wonder whether the severe hypoproteinemia, present only in this case since the inception of the illness twelve years before, might not have been related to the state of the liver.

No changes of the spleen characteristic or significant for sprue were observed.

Despite the implication of the adrenals[8] and the parathyroids[9] in the causation of steatorrhea, no definitive abnormalities were observed in this material. No satisfactory explanation can be offered at the present time for the conspicuous proliferation of connective tissue in the parathyroid gland of patient 30.

The observation of erythroid hyperplasia is not surprising, since this picture is frequently seen in many anemic states. The absence of the classic megaloblastic arrest at necropsy is most probably due in these cases to the preceding specific liver therapy.

The findings in the skin, especially in regard to pigmentation, do not differ from those previously described. The coloration is due to an increase in the melanin content of the basal layers of the epidermis. Hemofuscin has thus far not been found in the skin of these patients.

The pathologic alterations in the group of secondary sprue acted in a mechanically demonstrable way to interfere with intestinal resorption. This occurred either through direct involvement of the intestinal wall or the tributary lymph channels (lymphosarcoma and intestinal lipodystrophy). It should be pointed out that mechanical obstruction to such a degree as to permit similar clinical pictures was possible in the other 2 patients (cases 21 and 34), who had no mesenteric adenopathy or gross intestinal involvement. Only histologic examination was able to reveal sufficient structural damage (amyloid deposition). The inference is justified that the gross examination should always be supplemented by a critical scrutiny of the microscopic picture, even in seemingly negative cases. To our knowledge the importance of amyloid deposition in the small intestine for the production of the sprue syndrome has not received its deserved attention.[5]

Aside from the typical cases of primary sprue which present no diagnostic difficulties, there is a group of milder or incomplete clinical instances that remain diagnostic problems. There is the group of otherwise typical primary sprue without diarrhea, in which only the high fat content of the formed normal stool will establish the diagnosis. Sprue in partial remission may similarly resemble a forme fruste of the disease by the absence of diarrhea or presence of an iron-deficiency type of anemia instead of the characteristic macrocytosis and hyperchromia. Some years ago one of us (D. A.) published observations on small intestinal hypermotility in the presence of large amounts of fatty acids and soaps in the stools[10] in the absence of characteristic hematologic changes. Such patients present themselves in the clinics complaining of vague abdominal symptoms. We were of the impression that they also may represent mild or initial instances of primary sprue. In such instances the performance of dextrose and vitamin A tolerance tests is of great confirmatory value.

The response to specific therapy in primary sprue was variable. There were instances of complete cure without a relapse for many years, both in the tropical and in the nontropical variety of primary sprue. The majority of the patients with a prolonged course required continuation of liver therapy and special diet for long periods of time. Some of the patients had to be maintained on liver therapy for as long as twelve years. In others no complete remission, at least in regard to the function of the bowel, could be achieved. And there were, finally, therapy-resistant patients, who failed to respond to large amounts of the refined as well as of the crude liver extract and, as seen in 1 instance, to folic acid.

The role of folic acid in the therapy of sprue cannot be fully evaluated at the present time. It was given orally to 6 patients in amounts of 15 to 30 mg. a day. The observed effects resembled those of liver therapy, hematologically and coprologically, and were probably not better. The relationship of folic acid to liver therapy, to the intrinsic and extrinsic factors has not been established. Although the cost of adequate folic acid therapy is at the present time excessive, the ease of its administration offers definite advantages in a chronic disease of this sort. It is as yet unknown whether this factor has to be supplied continuously or periodically. We had no opportunity to use thymine or xanthopterine in the treatment of sprue.[11]

SUMMARY

1. Forty cases of the sprue syndrome are reported, which are divided into two groups comprising 36 patients with primary and 4 with secondary sprue.

2. The clinical differentiation of the two types of sprue was possible on the basis of duration of symptoms, presence of typical oral and lingual lesions, characteristic hematologic changes and response to therapy. The gastrointestinal observations were essentially similar in the two groups, as was a chemical analysis of blood, duodenal contents and feces.

3. Postmortem examination was performed in 10 cases, in 9 of which there were noteworthy findings and in 1 of which complete study was not possible.

4. The pathologic changes consisted of unique findings in intestinal villi (hyaline band formation) and mesenteric glands (disproportionate trabeculation). Amyloid involvement of the small intestine was observed in 2 instances. Abdominal lymphosarcomatosis and intestinal lipodystrophy each occurred once. Pigment deposition (hemofuscin) was encountered in 2 instances in the small intestine, and extreme steatosis of the liver was observed once. In 4 of the 6 patients whose disease was designated as primary sprue there were varying degrees of pancreatic fibrosis which were not accounted for by biliary disease. The possible relationship of the pathologic changes to sprue has been discussed.

ABSTRACT OF DISCUSSION

Dr. George Baehr, New York: Dr. Adlersberg has carefully reviewed the clinical course of sprue and has supplemented it with detailed biochemical studies not only of sprue but of the conditions that are associated with spruelike syndromes. It is important for clinicians to remember that there are variations of the clinical picture of sprue. Sprue in nontropical climates is often difficult to diagnose; in each instance one must always exclude the possibility of a pathologic lesion in the small intestinal tract. Regional ileitis, the disease described by Crohn, Guinzberg and Oppenheimer, is not infrequent. When extensive it may cause so pronounced a reduction in the absorption of fat and fat-soluble vitamins, and even of water-soluble vitamins and minerals, that a profound deficiency disease may be produced, which resembles closely the deficiency manifestations of true sprue, either the tropical or nontropical variety. Diseases of the mesenteric lymph nodes, especially lymphosarcoma of the intestine and lymph nodes, may also result in a multiple deficiency in absorption from the small bowel and induce a clinical picture which resembles, although it is not identical with, that of sprue. I am glad that Dr. Adlersberg stressed that true sprue occurs in temperate as well as tropical climates. Sprue can occur in persons who have never left the cities of this country. Doubt concerning the existence of nontropical sprue, the claim that the only true sprue is tropical, is no longer valid. Dr. Adlersberg's observations, as well as those of others, adequately demonstrate that there is typical sprue in this country, absolutely indistinguishable clinically, biochemically or pathologically from tropical sprue. Unquestionably, the disease is much commoner in tropical countries, where there are certain contributing factors, such as the greater frequency of intestinal disorders throughout childhood and adult life, which favor the appearance of this deficiency disease in certain predisposed persons. In the tropics there are also other causes for multiple vitamin and other nutritional deficiencies, such as differences in dietary habits, which must play a contributory role in precipitating the manifestations and multiple deficiencies which are called sprue, a disease characterized by a failure to absorb a variety of essential nutritional elements from the intestinal tract. Concentrated liver extract and folic acid, both of which are frequently effective in the treatment of sprue, are usually completely ineffective in the spruelike clinical picture accompanying organic diseases of the small intestines or of the mesenteric lymph nodes. Unfortunately, this is not a reliable differentiating criterion. There are cases of true sprue, tropical and nontropical, which do not respond completely to therapy with folic acid or with concentrated liver extract and will respond to a crude liver extract. There is something in crude liver extract which in some instances is better than either the more concentrated preparation or even folic acid.

Dr. Daniel M. Silverman, New Orleans: In 1924 I called attention to the endemicity of sprue in and about New Orleans in studies which included for the first time the analysis of pancreatic enzymatic concentrate of the duodenal contents in cases of sprue. Prior to that, Brown of Johns Hopkins had made such studies by analysis of the stool. He thought that in the stool examinations there was a deficiency of pancreatic enzymatic activity, but my studies of duodenal contents made with and by the epinephrine method showed what Dr. Adlersberg reported today, that those enzymes were normal. Unlike the case in pernicious anemia, I found that the gastric contents showed hydrochloric acid. These cases of sprue which originated in Louisiana did not differ from the true sprue which is imported, particularly from China and the Philippine Islands. The point brought out by Drs. Adlersberg and Schein that concomitant diseases may present the picture resembling that of sprue is well made in the light of my work in the South with the dysenteries. Like pellagra, sprue is associated not infrequently with Bacterium dysenteriae infection. As Dr. Adlersberg in pellagra syndrome found the strain of B. dysenteriae, so also in pellagra, in true sprues and in studies in recent years there have been found the so-called pathognomonic small intestine, mucosal pattern of sprue; namely, the segmentation and flocculation of barium in the small intestine is not always pathognomonic or characteristic of sprue. Colburn found it in cases of hyperproteinemia, primary and secondary deficiency disorders. It is not infrequently found in chronic infections due to Salmonella and B. dysenteriae. With reference to treatment, results of modern methods are better than were some of those used twenty-five years ago. With infections due to the Salmonella, much lemon juice and large doses of meat, which patients had not been accustomed to eating, were given.

Dr. J. E. Gossard, Sierra Madre, Calif.: I have 5 patients with sprue now under my care, so I am grateful to Drs. Adlersberg and Schein, especially for the pathologic demonstrations. One should also thank Dr. B. K. Ashford for studies which, although made years ago, were effective in the treatment of sprue. They may be found outlined in Tice's Practice of Medicine, volume 4, page 190—"no less than a pound of meat per day is recommended." It now seems that general practitioners everywhere should be warned to keep a sharp lookout for the disease. Any chronic peasoup diarrhea with macrocytes in the blood should be further studied. Achlorhydria and a peculiar typical tongue may or may not come into the clinical picture early.

Dr. David Adlersberg, New York: In regard to therapy of sprue, many patients responded more satisfactorily to crude than to refined liver extracts. Some of them were cured by a single course of specific therapy and never relapsed, while others required, almost like persons with pernicious anemia, continuous therapy over many years. The so-called deficiency pattern of the small intestine is not specific but is characteristic of sprue. I think this is the best way to say it: A similar pattern may be found on roentgen examination of the small intestine in hypoproteinemia or allergic shock or may be produced by the administration of morphine or by the addition of oil to the barium suspension. Despite all these limitations, the "deficiency pattern" is still characteristic of sprue. There are many forms or types of sprue that present difficult diagnostic problems and remain undiagnosed. They may resemble that seen in the typical sprue patient who under therapy went into a partial or incomplete remission, who may then show practically normal blood values and normal looking bowel movements, but with an excessively high fat content of the latter (40 to 50 per cent of the dried fecal material). The sprue of the average patient remains undiagnosed for many months. It is especially for the diagnosis of the atypical and mild cases of the disease that the laboratory tests are of great diagnostic help, especially the "flat" vitamin A tolerance test, the "flat" dextrose tolerance test and the quantitative determination of the fecal fat content, as well as the fecal fat partition.

THE MECHANISM OF AMPHETAMINE-INDUCED LOSS OF WEIGHT

A Consideration of the Theory of Hunger and Appetite

STANLEY C. HARRIS, Ph.D.
A. C. IVY, Ph.D., M.D.
and
LAUREEN M. SEARLE, B.S.
Chicago

It is generally agreed that the administration of amphetamine ("benzedrine") facilitates the reduction of weight. This effect of the drug was first reported in 1937, when patients receiving amphetamine for other purposes were observed to lose weight.[1] Since that time a number of papers have appeared in which the drug has been reported to be of value in the management of obesity.[2] However, it has not been demonstrated by controlled experiments that the drug actually causes a reduction of body weight.

The mechanism by which the drug apparently facilitates the loss of weight has not been settled. All the possible mechanisms have been suggested in the literature and are summarized in the following outline.

The drug acts to facilitate the loss of weight:

- A. By increasing the expenditure of energy
  - (*a*) by increasing the basal metabolism as does dinitrophenol or
  - (*b*) by increasing muscular activity by causing restlessness
- B. By tending to induce negative water balance by promoting diuresis or reducing the intake of water
- C. By causing incomplete digestion or absorption of food
  - (*a*) by decreasing motility or
  - (*b*) by decreasing secretion
- D. By reducing the ingestion of food
  - (*a*) by decreasing the tone and motility of the empty or fasting stomach or
  - (*b*) by decreasing the desire or appetite for food.

DATA IN THE LITERATURE

Results reported in the literature indicate that a dose of from 10 to 40 mg. of amphetamine sulfate increases the basal oxygen consumption of man from 0 to 15 per cent depending on the dose and the individual. The increase lasts up to nine hours but not as long as twelve to twenty-four hours.[3] In human subjects it has not been quantitatively determined whether the increased metabolism, when it occurs, is due to physical activity (restlessness) or to an increase in general cellular oxidation. The consensus is that it is due to restlessness. In rats it has been shown definitely that the drug increases spontaneous physical activity[4] and that this effect diminishes on repeated administration.[4b]

Diuresis has been suggested as the cause of a portion of the loss of weight associated with the administration of amphetamine.[5] Both diuretic and antidiuretic effects have been reported.[6] In anesthetized dogs only the first dose has been found to cause some diuresis; the failure of repeated doses to cause diuresis has been explained as due to a disappearance of the pressor effect of the drug.[7]

Doses of the drug which in rats cause an increase in spontaneous activity do not cause a wastage of food in the feces.[4b] Though doses of 5 to 30 mg. in man may inhibit gastric motility and slow the rate of gastric evacuation[8] and increase slightly gastric secretion,[8b] there is no evidence to show that such effects influence the digestion and absorption of food. The factor of safety in digestion and absorption is large.

No reports in the literature have presented objective data substantiating the impression that amphetamine decreases dietary intake. Likewise, we have found no experiment which has proved that amphetamine itself will cause a loss of weight.

REPORT ON EXPERIMENTS

EXPERIMENT 1 A.—*Does amphetamine sulfate decrease food intake and body weight in human subjects?*

Methods.—Seven obese and two nonobese volunteer subjects were fed three meals a day for two eight week periods separated by a four week vacation. The subjects were permitted to eat only food provided by our kitchen, although they could eat as much or as little of any item as they desired. The amount of each item that each person ate at each meal was recorded. To minimize monotony, three different menus were used and the same menu was presented every fourth day. The only difference between the two eight week periods was that sandwiches before retiring were provided when desired during the second period.

The first day of each week each subject was weighed before breakfast, stripped and after voiding.

During the first two weeks of each period no medicament was given. During the second two weeks each subject was given a placebo capsule to take one hour before each meal. During the first period all 7 obese subjects were given 5 mg. of *d*-amphetamine sulfate ("dexedrine") one hour before each meal in the fifth and sixth weeks, and the dose was raised to 7.5 mg. during the seventh and last week for 4 of these 7. Placebos were given to the nonobese subjects during the third to sixth weeks. They then received 5 mg. of *d*-amphetamine sulfate before each meal during the last two weeks of this first period.

* Two weeks.

In the second period 2 of the 6 obese[9] subjects received 10 mg. of *dl*-amphetamine sulfate before each meal through the fifth, sixth and seventh weeks and 15 mg. during the last week. The other 4 received 5 mg. of *d*-amphetamine sulfate before each meal over the same period of time, and all but 1 had each dose raised to 7.5 mg. the last week. One nonobese subject received 10 mg. of *dl*-amphetamine sulfate and the other 5 mg. of *d*-amphetamine sulfate before each meal during weeks six and seven and 15 mg. of *dl*-amphetamine sulfate and 7.5 mg. of *d*-amphetamine sulfate, respectively, during the last week.

Results.—The data on the caloric intake and body weight of the subjects are presented in tables 1 and 2. These data when averaged for the group are presented graphically in chart 1.

It is to be noted from chart 1 and table 2 that the obese subjects lost weight when placed on a diet which allowed them to eat all they wanted three times a day and nothing between meals. Part of this may have been due to a desire on the part of 3 of them to lose some weight. They also lost weight during the experiment of the second eight weeks, in which they were allowed to eat before retiring, if they desired.

Placebo capsules had no effect on the average rate of weight loss, but the amphetamine definitely decreased the intake of food and increased the rate of weight loss.

It is to be noted that during the vacation period of four weeks, 5 of the 6 subjects regained some of the weight which they had lost. The 1 subject (G. L.) who was determined to lose weight lost 1.5 pounds (0.7 Kg.) during the four weeks vacation but not as much as during the periods of amphetamine administration.

EXPERIMENT 1 B.—*Does amphetamine sulfate decrease food intake and body weight in canine subjects?*

If amphetamine sulfate should decrease the intake of food in canine as well as in human subjects then it would be possible to investigate experimentally the site of action of the drug.

Methods.—Eight dogs were permitted to eat as much food as they desired during a single forty-five minute period each day. The meals were always the same in character, and the animals were fed and cared for by the same few persons throughout the year of experiments. The quantity of food eaten by each animal each day was carefully weighed and recorded. The animals were weighed every five to seven days. When a medicament was administered it was injected by the subcutaneous route one hour prior to feeding. Isotonic solution of sodium chloride was used for control injections.

Results.—The results are shown in table 3.

It is evident that if 2.5 to 20 mg. of *d*-amphetamine sulfate are given, hypodermically to a dog one hour before the presentation of a meal the intake of food is decidedly decreased. A dose of 10 to 20 mg. was required to abolish practically all food intake for a period of two weeks. One dog, not shown in table 3, was injected with 10 mg. of the drug one hour before the presentation of food daily for twenty-eight days, during which period the animal ate a total of only 150 Gm. of food. Dog 4 (table 3) ate only 50 Gm. of food during the first ten days when it was injected with 5 mg. of the drug; another ate nothing for twenty-one days. Dog 8 ate nothing for eighteen of the thirty days when it received 5 mg. of *d*-amphetamine sulfate and ate only 10 per cent of its normal intake during the entire thirty day period, during which it lost 26 per cent of its original body weight.

* First week of medication.
† Increased dose.

---

[9] One subject withdrew from the experiment at the end of the first period.

Other points established during this experiment will be mentioned. First, when the administration of the drug was discontinued and isotonic solution of sodium chloride was injected instead, the animal ate voraciously. There was no evidence of conditioning to the injection. Second, when a dose of the drug which caused only about a 50 per cent reduction in the intake of food was given daily, the drug became less and less effective. This may have been due to the development of tolerance to the anorexic effect of the drug or to the accumulating dietary deficit. Third, the animals even when injected with relatively large doses of the drug continued to manifest interest in being fed. They were always fed in the same order and displayed the same jealousy when the dog ahead was being fed. They maintained interest until the pan of food was placed in the cage, after which they would smell it and turn in a circle; look at it and turn again, and then lie down or watch the person who fed them complete his work. The animals failed to manifest any behavior suggesting dependence on or craving for the drug. Only 1 animal started out by resisting the injections and continued to do so.

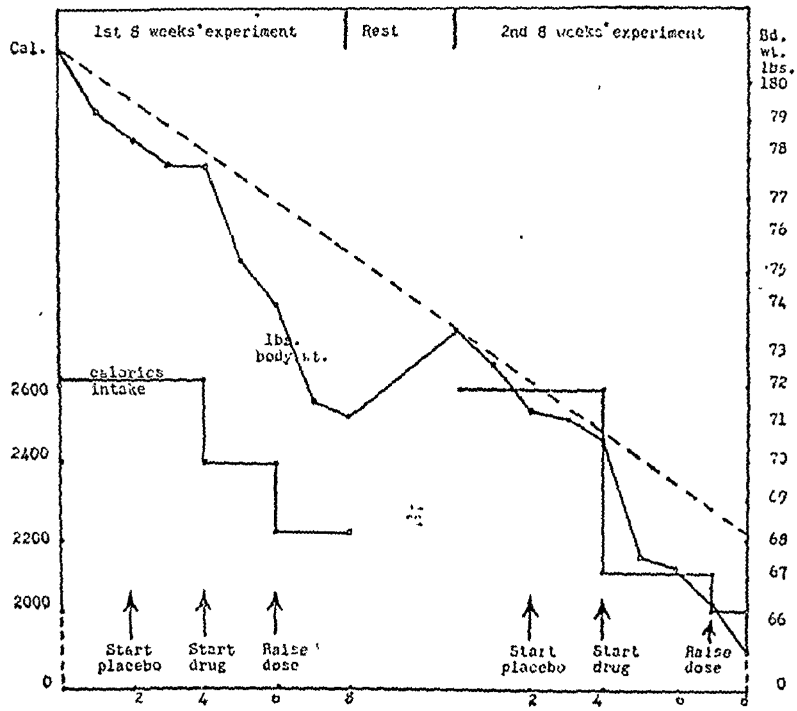

Chart 1.—Obese subjects on ad libitum diet.

Experiment 2.—*Does amphetamine sulfate cause a loss of weight in human subjects when the caloric intake is maintained regardless of anorexia?*

It was believed that if amphetamine sulfate caused a loss of weight by some mechanism other than by decreasing the intake of food this could be demonstrated by placing subjects on a constant diet and having them eat all the food presented, even though they did not desire it after taking the medicament.

Methods.—Ten volunteer medical students of normal weight were obliged to eat 3,000 calories at the three meals served to them each day for fourteen consecutive weeks. The diet was well balanced, and except for meat, potatoes and dairy products items of the diet came from canned foods. Each item of canned food was always from the same pack, in order to insure against changes in caloric, vitamin or mineral content of the menu. These men lived together in a dormitory and were weighed immediately after arising and voiding, every fourth morning. Placebos were given before each meal during the third and fourth weeks. From the fifth week, subjects 1 to 5 received 10 mg. of *dl*-amphetamine and subjects 6 to 10 received 5 mg. of *d*-amphetamine before each meal, every day until the thirteenth week (fifty-six days), when placebos were again given until the end of the experiment.

Results.—The body weight of each subject at each weighing is shown in table 4. In the last column of table 4 is shown the average weight of the group for eight day periods, excluding subject 6 who was sick for two weeks. The significance of the rate of loss of weight before, during and after the period of amphetamine becomes apparent on the inspection of chart 2.

It is to be noted that a loss of weight occurred during the twenty-six day control period. Evidently the 3,000 calories allowed each subject was inadequate to maintain the body weight of the group; in fact, it was adequate for the maintenance of body weight in only 3 of the 10 subjects. The group lost an average of 0.7 pound (0.3 Kg.) during the twenty-six days of control, which is at a rate of approximately 0.03 pound (0.01 Kg.) per day. Then, on taking amphetamine, the loss of weight became precipitous, 1 pound (0.5 Kg.) being lost in a week. After this, however, only ½ pound (0.23 Kg.) was lost in forty-eight hours.

It is to noted also that 3 of the 10 subjects (1, 4 and 10) did not lose any weight during the control period, which shows that the allowance of 3,000 calories was adequate. One of the 3 (subject 10) did not manifest a significant decrease in body weight when amphetamine was given, while the others (subjects 1 and 4) did.

These observations show that in some persons a dose of 5 mg. of *d*-amphetamine sulfate or 10 mg. of *dl*-amphetamine sulfate does not have a sufficient effect on total energy metabolism or other mechanisms to cause a loss of body weight when the caloric intake is constant. In other persons these doses of the drug are adequate to increase the total energy metabolism or total loss of water by the body enough to cause a temporary increase in the rate of weight loss. The fact that the acceleration of weight loss due to the drug is temporary indicates that a tolerance results. This is also characteristic of the results of the preceding experiments.

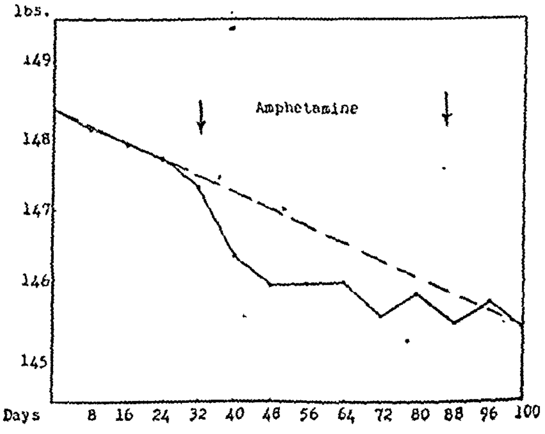

Chart 2.—Rate of loss of weight before, during and after the administration of amphetamine.

This experiment has clearly shown that amphetamine-induced loss of weight is almost entirely due to anorexia.

As little as a 10 per cent increase in general metabolism can account for the extra weight lost during the first few days of medication. This explanation is particularly feasible because some degree of wakefulness was reported by all but the 2 subjects (1 and 10) who lost least on medication. Obviously, if sleeplessness occurs and restlessness prevails, a 10 per cent increase in the utilization of energy is entirely possible. It must also be reported that by coincidence the final examination period coincided with the first week of medication. That this might be significant is suggested by the fact that subjects 1 and 10 were upperclassmen and had only a few examinations to take.

The total daily urinary output of each of these subjects was collected for the purpose of studying the metabolism of the drug.[10] The results showed no increase in urinary output during the first four to eight days of medication.

The averages exclude the record of subject 6, who was sick most of the time.

Experiment 3.—*Does amphetamine cause anorexia in dogs when the stomach and upper part of the intestine are extrinsically denervated?*

In the previous experiment it has been found that the chief cause of weight loss when amphetamine is given is a decrease in the desire for food. This might be due to a decrease in

gastric hunger tone and motility. To examine this question the stomach and upper part of the intestine were denervated.

Method.—Four of the same dogs used in the previous experiment were subjected to a supradiaphragmatic bilateral vagotomy and later to bilateral splanchnolumbar sympathectomy verified by autopsy.

The effect of the operation on the intake of food was followed, and then the effect of the drug was determined.

Results.—The results are summarized in table 5.

Comparison of the results in table 5 with those in table 3 shows that the anorexia produced by amphetamine is not interfered with by the interruption of sensory nerves from the stomach and intestines. It is also noteworthy that the eating behavior of these animals was the same after as before surgical intervention even when no medicament was administered.

EXPERIMENT 4.—*Does the rather prolonged administration of amphetamine cause any evidence of disturbance of tissue functions in human subjects?*

Since we were planning to give amphetamine over a period of several weeks, it was decided to ascertain if changes in various functional activities might be detected.

Methods.—Blood Studies: Each Monday morning before breakfast, during the first experiment of eight weeks (with food ad libitum) on human subjects, a sample of venous blood was withdrawn from each subject. Red, white and differential counts were made on this blood, and the hemoglobin concentration and blood sugar levels were determined. The method of Sahli was utilized for the hemoglobin test, and the technic of Somogyi was employed for evaluation of the blood sugar level.

Cardiovascular Studies: At the time when blood was withdrawn for the previous tests the systolic and diastolic blood pressures and the pulse rates were determined after the subject had spent at least five minutes in the reclining position.

Kidney Function Tests: Each Monday morning the first urine specimen of the day was brought to the laboratory to be tested for albumin by the nitric acid test and for sugar by the qualitative method of Benedict.

Additional Tests: A sugar tolerance test was performed on the subjects of human experiment 1A, at the beginning of the experiment and at the end of the twenty-eight days of medication. Each subject was given by mouth 1 Gm. of dextrose per kilogram of body weight immediately after a sample of blood was drawn. Samples of venous blood were again drawn thirty, sixty and one hundred and five minutes after the ingestion of the sugar, and all samples were analyzed for dextrose by the method of Somogyi.

The blood serum phosphatase concentration was determined by the method of Bodansky (1) after twenty-six days of medication on the subjects of the first eight week experiment and (2) both before and after fifty-five days of medication during the human experiment 2.

The blood ascorbic acid level of the subjects of the third human experiment was determined twice by Roe's method before medication was begun and after the second and the sixteenth day of medication.

For a rough estimation of total alimentary passage time, three size 00 capsules containing carmine powder were given to each subject during human experiments 1A and 2 just before supper. The time of first appearance and disappearance was noted. This was done twice before medication was begun in experiment 1A and 2, and after nine days of medication in experiment 1A and forty-eight days of medication in experiment 2.

During experiment 2 each of the 10 subjects collected his entire urinary output for all but the first seven days of the experiment. Each daily sample was started after the first morning sample and concluded after the next morning sample. The specimens of urine were kept in bottles, to each of which had previously been added 5 cc. of glacial acetic acid. When the specimens were brought into the laboratory the volume was recorded and two 25 cc. aliquots were taken. One aliquot was frozen and stored for reference, and the other was assayed for its amine content. The assay technic was a combination of certain features of the methods of Beyer and Skinner, Richter, Jacobsen and Gad. The method is presented elsewhere.[10]

Results: The results of several of the tests which we performed on our subjects confirmed studies already reported. These, all of which showed no change, were: red and white blood cell counts, hemoglobin determinations, fasting blood sugar levels, sugar tolerance curves and urinary sugar and albumin tests.

* Excluding subject 7.

The results of studies which have not been reported heretofore on subjects receiving amphetamine sulfate were: the blood ascorbic acid levels, which were not altered[4] (table 6). The blood serum phosphatase was not altered (table 6). The results of the studies on total alimentary passage time (table 7) show that it was not altered by the drug. The metabolism of the drug, probably by the liver, was not altered.[4] The blood pressure was not changed.

No evidence of toxicity of the drug as employed in these studies was found. This was anticipated in view of the relatively low toxicity of amphetamine.

Experiment 5.—*Does amphetamine cause anorexia in human patients with bulimia after frontal lobotomy?*

With the idea in mind that amphetamine might decrease dietary intake by acting on the frontal lobe, the drug was given to 6 patients who had developed bulimia subsequent to a frontal lobotomy.

Methods.—Six patients were studied, through the cooperation of Dr. E. Liebert. Each patient was given 10 mg. of *d*-amphetamine sulfate subcutaneously one hour prior to lunch and supper on two successive days. We consider this dose to be relatively large for the human subject. The dining room attendant was asked to record whether the patients ate the usual amount or less.

Average	23.9	23.2	27.9	48.7	51.8	46.6

Results.—During the first day of the experiment none of the patients ate less. During the second day, 1 patient ate less at lunch and 2 less at supper.

The results indicate to us that the patient with a frontal lobotomy is less susceptible to the anorexic effect of amphetamine than is a normal person. Because of the lack of adequate quantitative control data, the results are mentioned solely for their provocative value.

COMMENT

The data show clearly that the administration of amphetamine sulfate can cause in man and dog a loss of body weight which is associated with a reduction of voluntary food intake. When the caloric deficit which results from the decrease in dietary intake is calculated over a period of from two to four weeks, it is found that the loss of body weight is accounted for by the decrease in food taken. (We allow 7.7 calories per gram of weight lost.[11]) However, both collectively and individually more weight was lost by some subjects during the first week than could be accounted for by the caloric deficit due to a decreased intake of food. This extra loss of weight could not be ascribed to diuresis, since the increase in urinary output was not significant.[10] Neither could it be ascribed to an increase in the basal metabolic rate, which was not changed. However, the total metabolism during the period of drug action could be increased while the basal metabolic rate remains normal. An increase of 10 to 20 per cent in total energy metabolism or an extra loss of 100 cc. of urine or body water a day for a few days or some combination of these two factors would balance the energy-body weight account. Substantiation of these interpretations is found in the failure of 10 men of normal weight on a constant caloric intake to lose any appreciable amount of weight during fifty-six days on a dosage of 10 mg. of racemic amphetamine sulfate or 5 mg. of *d*-amphetamine sulfate before each meal. Again in this experiment the greatest individual (3 pounds, or 1.4 Kg.) and average (1.4 pounds, or 0.6 Kg.) loss of weight occurred during the first four days of medication, a quantity which could be accounted for by a modest increase (average 9.2 per cent) in total energy metabolism and body water output.

It is conceivable that this drug may cause anorexia by initiating some type of intoxication. We failed to find that any evidence of chronic toxicity of therapeutic doses of the drug was revealed by tests directed to evaluate the function of the liver, bone marrow and kidney. It is also significant in this connection that these observations confirm the reports in the literature. The appetite immediately returns to normal after the dosage of the drug is discontinued. It is also conceivable that amphetamine acts on the liver, adrenals or some other tissue to cause the production of an unknown substance, which in turn acts on the brain. This possibility seems remote, however. It was thought for several reasons that amphetamine might induce anorexia by affecing the frontal lobes of the brain.

Since the loss of weight observed during these experiments has been principally caused by decreased caloric intake, our attention passes to a consideration of the mechanisms by which the desire to eat is reduced by the drug. It was truly remarkable that by the appropriate administration of amphetamine to the dog, it would starve in the presence of food. This rendered it possible to determine whether the drug abolished the desire for food by acting peripherally on the alimentary tract or centrally on the brain. Because 4 dogs demonstrated unchanged eating behavior and a typical anorexic response to amphetamine after surgical ablation of the sensory nerves (vagi and thoracolumbar visceral afferents) of the gastrointestinal tract, it was concluded that the drug produces anorexia through some action of the central nervous system.

The fact that amphetamine still decreases or may abolish all desire for food after the gastrointestinal tract has been denervated is an important physiologic observation pertaining to the mechanism of hunger and appetite. It shows that the peripheral gastrointestinal sensory aspect of hunger (hunger pains or contractions) in the adult (or conditioned animal) are not important in the control of dietary intake and must be considered as adjunctive in the adult. However, it is not necessary to believe, as is implied in some textbooks of physiology, that the phenomenon called hunger is derived from and solely dependent on hunger contractions of the fasting stomach.

---

[11] Best, C. H., and Taylor, N. B.: The Physiological Basis of Medical Practice, Baltimore, Williams & Wilkins Company, 1945, p. 610.

Since hunger and appetite are confused in current thinking and, in fact, frequently used synonymously, and since the interpretation of the action of amphetamine requires a definition of these terms, they will be defined and discussed.

Historically two general factors, referred to as hunger and appetite, have been concerned in exciting food behavior in the adult. The term hunger has been used to designate the inherent, instinctive or unconditioned aspect and appetite as the learned or conditioned aspect of food behavior.

There are two basic observations, easily confirmed, which indicate that hunger and appetite may be differentiated. First, decerebrate animals and the anencephalic infant manifest decerebrate activity in presence of gastric hunger contractions which occur after the abstinence of food, and the decerebrate activity is abolished some ten or fifteen minutes after they have been fed.[12] Second, the otherwise intact adult animal will feed after the alimentary tract has been extrinsically denervated, and a desire for a particular item of diet may be learned.

With reference to the first observation, the decerebrate activity of hunger has been explained as due to the stimulation of centers below the cerebrum by afferent impulses from the esophagus, stomach and duodenum. That is, the decerebrate activity of hunger is considered to be entirely reflex in genesis. The fact that the activity is abolished so soon after feeding indicates that the abolition of the activity is probably not due to absorbed food acting on the hunger center or centers. However, food such as dextrose has not been given intravenously to ascertain if the activity is or is not abolished. Neither has the extrinsic innervation of the alimentary tract been removed to ascertain if decerebrate hunger activity still occurs.

With reference to the second basic observation, the animal with an extrinsically denervated alimentary tract may feed because of (*a*) learning, (*b*) sensations of weakness or emptiness from somatic tissues or (*c*) the lack of adequate food in the blood. Sensations from somatic or visceral tissues are not appreciably concerned; a dog with the vagi sectioned and a spinal transection (eighth cervical) voluntarily ingests and manifests interest in food and maintains his weight.[13] The role that the composition of the blood plays in the genesis of food behavior in such a dog is unknown, but appetite based on learning certainly exists.

It is obvious that the basic requirements for a learned food behavior are present in the newborn. In accordance with the most widely accepted theory of learning, the animal is born with a set of unconditioned reflexes, which serve as the basis of learned, conditioned behavior or reflexes. The decerebrate activity of hunger is undoubtedly due to unconditioned reflexes. Nursing is another set of unconditioned reflexes associated with feeding behavior. The association of these two sets of reflexes at the time when the brain is developed to the point that association may occur is probably the beginning of appetite. In the human being, the psychic secretion of gastric juice, which is considered to be a conditioned reflex associated with pleasurable experience, occurs at the age of from 6 to 8 months:[14] this may be antedated, however, by the formation of an appetite or a simple type of conditioned food behavior and pleasurable experience.

On the basis of these considerations, one of us (Ivy[15]) has proposed the following definitions of hunger and appetite: "Hunger is a bodily state which is characterized by certain specific activities induced independently of learning (conditioning) by the abstinence from food of a general or specific type and abolished by the intake of food of a general or specific type." The expression "specific type" refers to such food factors as lack of salt (salt hunger) and water (thirst) and certain essential food accessories as vitamins, bulk and minerals. At present it is not known whether the "hunger center" in the brain which is responsible for "certain specific activities" is excited by sensory impulses from the visceral and somatic tissues or by changes in the composition of the blood. Appetite is a conscious[16] (mental) state which is characterized by a desire for food dependent on learning and induced by interest in food, which is due to the sight, smell, taste or thought of (or abstinence from) food of a general or specific type, and which is abolished by the ingestion of the general or specific type of food (to the point of satiety). That is, appetite is the conditioned or psychic component of hunger in the same sense that pain is the psychic or mental adjunct of a primitive, unconditioned avoiding or protective reflex. For example, such a view is required because there is no particular area in the cerebrum which, when stimulated, will give rise to appetite or pain, and an appetite or pain aura does not occur in epilepsy; moreover, there is no primary sensory cerebral area for appetite and pain, which are examples of a pleasurable and a displeasurable sensation or experience, respectively. However, it is well known that areas in the parietal and frontal lobe may be so involved by disease as to decrease the sensation of pain or the appetite for food. Similarly it is known that morphine, for example, decidedly changes a patient's attitude or reaction toward pain. Similarly, amphetamine may affect appetite or a person's attitude toward food.

From the preceding discussion it should be clearly evident that it is theoretically possible for a drug to diminish appetite by acting on the hunger-appetite mechanisms in the brain. Because infectious diseases and fever decrease appetite, it has been conjectured that amphetamine decreases appetite by causing some similar type of intoxication rather than by a direct action on the brain.

We suspect with Lesses and Meyerson[2a] that the drug decreases a desire for food by increasing hedonic tone or interest in other matters. This is supported by Ulrich's report[1c] that he attained more success with amphetamine in reducing the weight of obese narcoleptic persons than of obese alert patients. And there seems to be no doubt that some obese patients eat excessively to substitute for lack of pleasure derived from other pursuits. Also, one of the well recognized effects of amphetamine is to increase the willingness to endure. This assists the patient to overcome any anhedonia or to say "no" to the pleasures of eating. In the dog, however, no problem of will power is concerned.

However, the facts do not permit us to conclude that amphetamine causes anorexia only by acting on the cerebrum. It is possible that the drug acts at a lower level, or at the level of the hunger center, or at both the cerebral and hypothalamic levels. In this connection it would be well to know the effect of the drug on the decerebrate hunger activity of the pigeon, dog and monkey. In fact, one interpretation of the food behavior of the dog after the administration of amphetamine would suggest that the drug paralyzes the sense of smell for food. The dog that has received amphetamine is sufficiently interested in food to be jealous when it is being served to other dogs, yet the animal does not eat that which it is served.

[15] Ivy, A. C.: Report to the Planning Division, Quartermaster Corps, United States Army, 1945.

[16] Consciousness is considered to be a state of discriminative awareness.

In accord with present information, the anorexia-producing effect of amphetamine appears to be quite characteristic of the drug in the dog. The dose which completely prevents caloric intake does not cause obvious excitement, nausea, ataxia or other signs. The anorexia caused by the drug is different from (*a*) that of alcohol, which causes ataxia; (*b*) that of morphine, which causes nausea and sleep; (*c*) that of fever-producing substances, which decrease interest in things in general, and (*d*) that of noneuphoria-producing toxic substances, which cause generalized depression.

Among the various agents which cause anorexia, amphetamine appears to resemble cocaine most closely. However, Grossman and Cummins[17] find that 60 mg. of cocaine hydrochloride are required to cause any anorexia in the dog. This is at least ten times the dose of amphetamine sulfate which would be required.

In the use of amphetamine in the management of obesity the possibility of the development of tolerance must be considered as well as the contraindications. We observed no evidence of habit formation in our subjects.

SUMMARY AND CONCLUSIONS

1. It has been demonstrated by controlled experiments on human and canine subjects that the administration of amphetamine sulfate may cause or facilitate a loss of body weight in obese and nonobese persons.

2. The evidence shows that the loss of weight observed in these experiments was due primarily to a reduction in the intake of food.

3. In a group of 10 subjects who maintained a constant caloric intake for one hundred days the administration of amphetamine sulfate for fifty-six days caused some loss of weight during the first four to eight days in 7 of the subjects. This weight loss was most reasonably attributed to a slight (approximately 10 per cent) increase in energy metabolism due to restlessness, which disappeared on the development of tolerance. No evidence of deleterious effects of the drug was observed.

4. A daily dose of 5 to 10 mg. of amphetamine sulfate injected subcutaneously into dogs (8 to 10 kilograms of body weight) one hour before the presentation of food, which was left in the cage for forty-five minutes, caused a complete abolition of food intake for from ten to twenty-one days in some dogs. This action of the drug was not influenced by extrinsic denervation of the stomach and intestine. We interpret the evidence as an indication that the drug produces anorexia by acting on an appetite mechanism in the cerebrum or on a hunger mechanism resident at a lower level (hypothalamus) or both. Means for testing the validity of this interpretation are suggested.

Clinical Notes, Suggestions and New Instruments

SENSITIVITY TO PENICILLIN RESULTING IN ABSCESS FORMATION

RICHARD A. CALL, M.D.
Salt Lake City
and
LIEUTENANT RICHARD A GILBERT
Medical Corps, Army of the United States

The reports of sensitivity to penicillin are ubiquitous in the medical literature and may be epitomized in the following manner: Lyons[1] reported such reactions as chills, fever, headache and eosinophilia, while Strazza[2] gave the case history of a patient with delayed sensitization to penicillin, similar to serum sickness. Hailey and Millard[3] reported a similar syndrome. Keefer[4] and Creep[5] reported urticaria. Price, McNairy and White[6] reported a case of asthma. Other toxic manifestations have been thrombophlebitis,[7] bullous dermatitis,[8] gastrointestinal reaction,[9] contact dermatitis[10] and vesicular dermatitis.[11]

The case reported herein is unique in being the first report in the literature of the formation of a sterile abscess as the result of an untoward reaction to penicillin.

REPORT OF CASE

A white man aged 38, a soldier, was in excellent health until Aug. 20, 1945, when there developed a cellulitis of the right hand following a simple friction blister of the right index finger. Treatment consisted of oral sulfadiazine plus 320,000 units of penicillin given intragluteally in interrupted doses over a period of forty-eight hours. Four weeks later abscesses, multifarious in nature, developed at the site of the penicillin injection. These abscesses were treated without the use of chemotherapy.

On Sept. 24, 1945 the patient was wounded in the right lower leg by flying rocks hurled by an exploding shell. He sustained superficial injuries of the soft tissue over the anterior portion of the right lower leg with no involvement of the bone. Treatment consisted of sulfanilamide powder dusted on the surface of the wound. Three weeks later the site of the wound drained spontaneously, and because the attending physicians feared the development of osteomyelitis, 1,040,000 units of penicillin were given in interrupted intragluteal injections. The wound healed, and the patient was discharged from the hospital. Four weeks later multiple abscesses 1.5 cm. in diameter evolved on the right and left buttocks, which were the sites of the previous injections of penicillin. In addition a small furuncle appeared on the right lower leg, several centimeters from the old wound. An unknown dosage of penicillin was again given for five days, intramuscularly, in both buttocks and in the left arm.

All the abscesses healed, but three weeks later the patient returned with several furuncles on the lower part of the right leg and with abscess formation at the site of penicillin injections,

namely, both buttocks and the left arm. The treatment again consisted of 720,000 units of penicillin given intragluteally in interrupted doses. The patient was discharged three weeks later, after all signs of infection had vanished.

Five weeks after discharge, on Jan. 10, 1946, the patient came to the hospital with multiple abscesses at the former injection sites. These lesions were small, measuring 0.75 cm. in diameter. No penicillin was used at this time, and the abscesses rapidly disappeared.

On March 10, 1946 this man sustained a fracture of the mandible. An unknown dosage of penicillin was injected into the site of the fracture, and penicillin was subsequently used as a mouth wash. The fracture healed without complications. However, on April 13, 1946 a furuncle appeared on the lower part of the right leg. Penicillin, 1.8 million units in divided doses, was given intragluteally; the furuncle promptly disappeared, and the patient was discharged from the hospital on April 25. Twelve days later, on May 6, the patient was readmitted with multiple abscesses at the site of the last injection of penicillin (the buttocks).

Laboratory reports revealed that a culture of material from the furuncle exhibited the growth of Staphylococcus aureus and gram-negative bacilli. The fasting blood sugar level was 88 mg. per hundred cubic centimeters. Urinalysis was negative.

Interrupted injections of penicillin, dosage unknown, were given into the right thigh for a period of five days. The patient was discharged May 18. The patient returned again on July 16, 1946 with multiple abscesses of the right thigh. He was treated with oral sulfadiazine. At this time a sensitivity to penicillin was suspected. Laboratory studies included roentgenograms of the right leg, which failed to show any evidence of osteomyelitis or foreign body; culture from the abscesses on the thigh, which revealed Staph. aureus; a fasting blood sugar level of 98 mg. per hundred cubic centimeters and urinalysis, which proved negative.

The patient was given 160,000 units of penicillin by mistake; it was injected into the left buttock. He was again discharged on August 16. He was readmitted seven days later with multiple abscesses of the left buttock, the site of the former penicillin injection. No chemotherapy was used at this time, and the lesions rapidly healed.

On Nov. 19, 1946 the patient was admitted to the hospital to be studied for possible sensitivity to penicillin. There was no history of sensitization to drugs other than penicillin. Laboratory studies were made, and examination of the blood revealed normal conditions. The blood sugar determination was 83 mg. per hundred cubic centimeters. A blood culture exhibited no growth.

No untoward reaction occurred when 0.5 cc. of a solution of sterile water containing 10,000 units of penicillin was injected intradermally.

Several drops of the same solution, when dropped into the patient's eyes, did not produce conjunctival reddening.

In order to determine without question that the abscess formation was due to penicillin, 200,000 units of penicillin in 3 cc. of sterile water was injected into the left buttock, and 3 cc. of sterile water were injected into the opposite buttock. Some of the penicillin from the same vial was injected into another patient. This patient did not develop an abscess. Cultures taken from the vial of penicillin which was used in this experiment failed to reveal the growth of any organisms.

On Dec. 21, 1946 a sterile abscess developed on the left hip of the patient (site of the test penicillin injection), but there were no signs of an abscess on the right hip (site of the sterile water injection).

COMMENT

The injections of penicillin were received by the patient at many different army hospitals, and it is incredible that the penicillin could have been contaminated with a pyogenic organism in each of these hospitals. Rammelkamp[12] reported that the injection of turpentine into the subcutaneous tissue results in a pyogenic inflammation. It would seem that the tissues of this person are sensitive to penicillin or its impurities and that the tissues' response to the drug is much the same as that witnessed by Rammelkamp after the injection of turpentine into the subcutaneous tissue.

SUMMARY

This case of abscess formation at the site of injection of uncontaminated penicillin is to our knowledge the only case of this kind reported to date in the literature.

ABOLITION OF PAINFUL PHANTOM FOOT BY RESECTION OF THE SENSORY CORTEX

DEAN H. ECHOLS, M.D.
and
J. A. COLCLOUGH, M.D.
New Orleans

The phenomenon of painful phantom limb following amputation has yet to be explained, but a possible solution to the therapeutic aspect of the problem was submitted by Gutiérrez-Mahoney[1] in 1944 when he reported the complete disappearance of painful phantom fingers after resection of the hand projection of the sensory cortex. As early as 1911 Head and Holmes[2] had observed a patient whose painless phantom foot vanished after the development of a destructive lesion of the cerebral hemisphere. The purpose of this paper is to report the case of a patient dramatically relieved of an intensely painful phantom foot by resection of the corresponding portion of the postcentral convolution.

REPORT OF CASE

J. T., a white man aged 53, complaining of intense pain and numbness in the left foot, was examined at Charity Hospital in New Orleans and found to have impending gangrene due to peripheral vascular disease. On April 6, 1943 a lumbar sympathectomy was performed on the left side. The circulation was considerably improved, though the patient lost the little toe of the left foot because of gangrene. Later, a sympathectomy was performed on the other side. He continued to complain of numbness and pain, however, and in October 1943 requested that his left leg be amputated. Though the foot was fairly warm, amputation seemed advisable on the basis of the excruciating pain. The left leg was amputated above the knee. The wound healed by first intention, but convalescence was marked by throbbing pain in the stump and the prompt appearance of a painful phantom foot. The patient was discharged from the hospital on Oct. 28, 1943.

The patient was readmitted to the hospital twenty-seven months later on Jan. 21, 1946. During the intervening two years he had been constantly aware of his amputated toes, foot and ankle, which besides being painful were felt to be in a state of extreme plantar flexion. The almost intolerable pain was described as a dull ache which became sharp and intense when the stump was in a dependent position. Often, he experienced a burning sensation on the dorsum of the "foot."

Examination disclosed that the stump was well healed, the scar was freely movable and no neuroma was palpable. However, palpation of the scar was painful and caused a violent clonus of the stump.

On the assumption that the pain was of peripheral origin, the neuroma on the sciatic nerve was resected on Feb. 19, 1946. This procedure did not even temporarily abolish the pain or the phantom.

On March 2, 1946 the members of the neurosurgical staff were consulted in regard to the advisability of a chordotomy. We found the patient to be pleasant and cooperative but preoccupied with his painful phantom limb. As a therapeutic test the patient was given a spinal anesthetic, which resulted in anesthesia and motor paralysis below the level of the fifth

thoracic segment. The phantom foot disappeared and the pain was relieved for about five minutes, but both returned with such severity that two doses (¼ grain, 15 mg. each) of morphine sulfate were required to quiet the patient. The futility of chordotomy having been reasonably well established, resection of the sensory cortex was advised.

Five weeks later on April 11, 1946 the central sulcus of the right cerebral hemisphere was exposed by reflecting an osteoplastic flap. The anterior and posterior central gyri were identified by stimulation with a faradic current. When the sensory cortex for the leg was stimulated, the patient complained that the phantom foot felt hot; stimulation of the motor cortex for the lower extremity caused the stump to jerk. The portion of the sensory convolution for the leg and foot was excised (gray matter and some white matter). That part of the sensory gyrus on the medial aspect of the hemisphere was included in the dissection. On further electrical stimulation no sensations in the lower extremity could be produced. Before ablation of the cortex was complete the patient announced spontaneously that the phantom foot and the pain had vanished.

On the first postoperative day there was anesthesia to pinprick of the stump extending as high as the greater trochanter laterally, the inguinal ligament anteriorly, the perineum medially and the gluteal fold posteriorly. Two days after operation the patient began to have weakness and jacksonian convulsions involving the left side of the body. When he became stuporous and aphasic, an extradural clot was suspected and the flap was reopened. There was only a moderately sized clot between the dura and the bone flap. There was no intradural clot, but the exposed portion of the brain was found to be bright red from the subpial hemorrhage. The area of resection showed no change. The dura was again closed, and the bone and scalp were replaced. By the ninth postoperative day the patient was free of convulsions, was able to move his left arm and fingers and was regaining ability to talk. Sensation in the left thigh began to return about the fifteenth postoperative day and was complete on the twenty-fourth postoperative day. The hemiplegia had completely disappeared by the eighteenth postoperative day. No sign of the phantom or the pain reappeared, and the patient was discharged from the hospital on the twenty-eighth postoperative day, May 11, 1946.

The patient was examined by one of us on March 6, 1947, eleven months after the operation. Neither the phantom nor the pain had returned. The stump was also painless and nontender. Tactile and pinpoint sensations over the stump were normal. Dr. Harry Morris, orthopedic surgeon, who also examined the patient, reported that the stump was an ideal one in every respect.

Since the operation, incapacitating atrophic arthritis with pain and limitation of motion has developed. Most affected are both shoulders, all fingers, the right knee and right ankle and both temporomandibular joints. Neither hip is involved. Arrangements were made to hospitalize the patient for study and treatment of this new problem.

COMMENT

Our experience and that of Gutiérrez-Mahoney[1] with single cases suggest that the problem of painful phantom limb has been solved, but there is a possibility that this may not be the case. Recently, Horrax[3] performed bilateral resection of the sensory cortex for painful phantom hands and arms. Relief was complete for a few weeks, but the phantoms returned and were as painful as ever. In spite of the fact that his patient was a drug addict and a compensation case, Horrax is satisfied that resection of the sensory cortex will not abolish every phantom limb and has turned his attention to bilateral frontal lobotomy as a possible solution to such problems.

Whereas our experience with resection of the sensory cortex for pain includes 5 consecutive successful cases, only one resection was performed for a painful phantom limb. The other operations were for chronic pain of other types not relieved by chordotomy and sympathectomy. Although all persons who lose an extremity have phantoms,[4] less than 10 per cent have sufficient pain referred to the phantom to require surgical procedures such as revision of the stump[5] and sympathectomy.[6] Consequently, the cases requiring cerebral operations are too few to provide any one surgeon with extensive experience. It is important, therefore, that all cortical resections for painful phantom limbs be reported so that this operation can be correctly evaluated.

SUMMARY

A case is reported in which a painful phantom foot was abolished by surgical excision of the corresponding part of the posterior central gyrus. It is urged that all cerebral operations for phantom limb be reported so that the value of this procedure may be determined.

PREVENTION OF REACTION TO BAL

MAURAY TYE, M.D.
Boston
and
JOHN M. SIEGEL, M.D.
Baltimore

In the treatment of poisoning due to heavy metal with BAL (dimercaprol, or 2,3-dimercaptopropanol) undesirable side effects have been previously noted.[1] These reactions consist chiefly of some of the following symptoms: nausea, vomiting, headache, burning sensation of gums, nose and eyes, profuse lacrimation and salivation, abdominal cramps, flushing of face, tingling of extremities, burning of skin, feeling of constriction of the chest and restlessness. At times these complaints are so severe as to necessitate discontinuance of treatment.

In view of the close resemblance of the severe symptoms which BAL therapy caused in a patient being treated for arsenical dermatitis and hepatitis to those seen in cases of serum sensitivity reactions, 0.6 cc. of a 1:1,000 solution of epinephrine hydrochloride was given intramuscularly. He obtained rapid and complete relief.

Influenced by this response, we gave the patient 25 mg. of ephedrine sulfate by mouth one-half hour before the next injections of BAL in an attempt to prevent a recurrence of the reaction. None of the toxic symptoms were noted after any of the ten subsequent injections of graded doses of 2 to 4.5 cc. of a 10 per cent solution of BAL preceded by an oral dose of ephedrine sulfate.

A second case reaffirmed the foregoing observation. A Negro man with a generalized dermatitis due to a heavy metal was started on BAL therapy after being prepared with ephedrine sulfate, 25 mg., given orally a half hour before each injection. No toxic symptoms were noted. After the sixth injection (dose 4.5 cc.) had been given the 25 mg. ephedrine sulfate was omitted prior to the seventh dose. Within a few minutes the patient noted severe lacrimation, headache, a feeling of constriction in the chest and a burning sensation of the skin of the trunk. The following injections of BAL were preceded by 50 mg. of ephedrine sulfate a half hour before their administration, and none of the previous unpleasant symptoms were experienced.

CONCLUSIONS

Preparation of the patient with ephedrine sulfate shortly before the injection of BAL may lessen the intensity or prevent entirely the side effects of this valuable remedy.

Special Articles

SERMONS DELIVERED AT THE ATLANTIC CITY CENTENNIAL SESSION

THE GOOD PHYSICIAN

MONSIGNOR FULTON J. SHEEN
Washington, D. C.

Whenever a man sits down in a doctor's office both he and the doctor have the right to ask each other the question "What is your philosophy of the universe?" For unless his philosophy is right the doctor cannot be sure that his bill will be paid, and the patient cannot be sure that he will live to have a bill to pay. Before an architect builds a house he wants to know who is to live in it, and before a doctor treats a patient he ought to know whether he is treating a man or an animal.

Because the physician believes in the dignity of man he will never ask himself whether the life before him is valuable but rather will profess that it is sacred, and sacred means inviolable, because God alone is its Giver. Just as in the political order the physician will say that the state cannot take away his liberties because they are the endowment of the Creator, so neither will he take a life because that too has come from the Hands of a Heavenly Father. He will realize that his profession summons him to be the protector, the conserver and the guardian of life—not its destroyer. He will never commit murder, even under the name of euthanasia, for the Fifth Commandment still binds the physician of the world. No man calls in a physician to take a life but rather to see fulfilled in the order of nature what the Divine promised in the order of grace "I am come that you may have life and have it more abundantly."

Because the physician lives in a moral universe he will see that, just as the basis of psychosomatic medicine is the fact that man has a soul as well as a body, so too he will see, in addition to other valid explanations, that in some cases at least the effect of moral guilt on health is not to be discounted. Psychiatry will make greater strides at that moment when it admits a moral as well as a mechanistic universe and begins to see that the denial of guilt is the greatest cause of morbidity in certain types of patients; that the self centered are always the self disrupted; that excessive self expression is self depression, and that what religion calls a sinner is in the psychiatric order a man who is a problem to himself; that the flight from life today through alcoholism, opiates and noise is an indication that no man can live with himself when he has lost all respect for self; that, just as the cock crew when Peter denied Our Saviour, so too nature and the mind protest when man denies his God. What some patients need is not to analyze their attitudes but to confess their guilt; what they need is not sublimation but forgiveness. Relief comes not from having their sins explained away but from having them absolved; and in some cases at least the solution that must not be outlawed is that of the Great Physician Who first told the man his sins were forgiven and then told him to take up his bed and walk.

Because the physician has one of the noblest vocations given to man, namely to minister to the temple wherein Divine Resemblance dwells, he will always maintain a personal relationship with his patients, based on that of service and function, not on profit and gain. He will see that, just as dictatorships arise to organize the chaos created by a loss of personal responsibility, so too will state medicine arise to impose planned service on doctors who have forgotten duties to their patients. State medicine is in the medical order what totalitarianism is in the political order—the forcible imposition of a plan on men who have ceased to serve, love and respect. Dachau was based on a Planned Race; the concentration camps of Russia with their 15 million prisoners are based on Planned Economics; in like manner, the foolish handling of the levers of life will bring not Planned Parenthood but Planned Ruin.

A society that will not allow a man to choose freely the politicians who shall govern him will naturally be a society where he will no longer be free to choose the doctor who will treat him. When doctors oppose state medicine because they cannot make as much money as they do now, then state medicine is inevitable; when doctors oppose state medicine because they want to maintain a personal relationship with their patients, then the compulsory organization of human service is impossible. State medicine can enter the social order only when it batters through the door of the Physician on which is written "I came not to be ministered unto but to minister."

Because a physician believes that man was made for perfect Life and Truth and Love, he will see that the greatest tragedy of life is wasted pain. No man is better just because he suffers. Pain cuts and sears and sours the soul when one can see no purpose in it or if there is no one to love for whom it can be offered. Here is where religion comes to the aid of medicine. Christianity never promised to relieve pain, but it did give a way to transcend and transfigure it by uniting it with One Who after advocating sacrifice took His own medicine on a Cross. After all, what is pain but sacrifice without love, and what is sacrifice but pain with love? Pain may be from sin but not sacrifice. A mother keeps a vigil at the bedside of her sick child: neighbors call it "foolish," she calls it love. Not to believe that our pains can serve another good is to disbelieve in God. If we have blood banks on which the anemic may draw, may we not also have spiritual blood banks on which the morally indigent may draw for their redemption? If we transfuse blood why cannot we transfuse sacrifice, and if we graft skin why cannot we graft prayer? That incidentally is why we have contemplative orders and nursing sisters, to pray and to sacrifice for the weak members of the Mystical Body of Christ that they may be made whole.

The physician, then, who is conscious that he has a vocation as well as a profession will also bring to his patients a Divine Vision. In every aching head he will see a crown of thorns and will strive either to lift it off or to turn it into a garland of roses; every bruised

---

Excerpts from sermon delivered by Monsignor Fulton J. Sheen of the faculty of the Catholic University of America at the Centennial religious service, Ninety-Sixth Annual Session of the American Medical Association, Atlantic City, N. J., June 8, 1947.

hand to him will be pierced with nails, every body will be a Temple of the Holy Spirit and every foot will be the vision of one riven with steel; every ailing heart will remind him of One Who wore His Heart on His Sleeves that all might know a love that was as open as the world. Every mother in labor will remind him of that other Mother who at the foot of the Cross brought forth in the pangs of spiritual childbirth all who are brothers in Christ.

Then when the physician has made his last visit to a sick bed, and the veil of life is torn aside, he shall see the Lord and Master in whose name he labored, and he shall hear from His Lips the pledge of eternal salvation and the beginning of an eternal ecstasy: "I was sick—and you visited Me."

MEDICINE AND RELIGION

Dr. JOSHUA LOTH LIEBMAN
Boston

In the Book of Ecclesiasticus the famous Jewish Apocryphal writer Joshua Ben Sirach penned this immortal tribute to the physician: "Honor a physician with the honor due unto him . . . for the Lord hath created him. For of the Most High cometh healing . . . the skill of the physician shall lift up his head; in the sight of great men he shall be held in admiration."

We men of religion are gathered together this morning to give honor unto the physicians of this land—to pay tribute to the American Medical Association on its hundredth anniversary. We think of the manifold achievements of this great organization in creating new standards of medical education, in fashioning a code of professional ethics that could become the model for all other groups of thinkers and workers in the world, in combating ignorance and superstition, quackery and cultism. Through its superb publications, its Councils on Pharmacy and on Foods, its research work in the laboratories and in countless other areas of attainment the A. M. A. has proved itself to be one of the most vital instruments of social good and human progress in America.

There is a close relationship between religion and medicine. This has been true throughout the ages. Christianity with its compassionate concern with healing has been a superb patron and friend of all the healing arts. In my own Jewish tradition there has been an unbroken thread of interest in the cure of the diseases of life. Most frequently famous rabbis in Jewish history were at the same time practicing physicians combining an absorption in the laws of God with a concrete devotion to the well-being of man. Maimonides, the greatest Jewish philosopher and rabbi of the Middle Ages, was at the same time a distinguished physician; indeed much of his medical writing is astonishingly modern in tone. Religion and medicine at their best are allies in the quest for the good, the healthy, the creative life.

Not that the relationship of religion and of science has not often been a very turbulent one. There have been periods of great estrangement, as it were, between the families of science and religion, and also wise attempts at reconciliation. As so often happens in human affairs, false pride is involved, regrettable attitudes of superiority or contempt both on the part of the laboratory and of the sanctuary. Today at this most dangerous moment in human history religion and science must recognize their interdependence, must learn to transcend old wounds and hurts, to forget what partisans on both sides have regrettably said and done, and recognize that each has much to learn from the other and that there are vital unities which bind them together—a therapeutic intent which may yet heal and save mankind. Prophetic religion and scientific medicine meet in the fact that both of them are built on *faith*, share creative *curiosity* and subordinate themselves to necessary *discipline*. Science calls its faith by the name of assumption or hypothesis, yet often its greatest discoveries are achieved by what the late Walter Cannon called "serendipity," a creative hunch or an intuitive leap into the unknown. Religion calls its faith by the name of doctrine, dogma or belief.

Faith, curiosity, discipline are common both to prophetic religion and to scientific medicine. Obviously there are differences between the two which must not be blurred. Religion must concern itself primarily with the goals and values of life, whereas science concerns itself primarily with the facts and means of life. The interdependence, however, is so inescapable that no rigid barriers can or should be erected between the sanctuary and the laboratory.

There should be a "two-way passage" between medicine and religion. Religion can learn much from the practice as well as the theory of medicine—it can learn the blessings that come to the world through the unfettered use of reason and experimentation, through the attitude of tentativeness and absolute humility before the facts—the attitude that Huxley described in his famous phrase "Sit down before the facts as a little child or you will know nothing." Religion, which often speaks eloquently about the dignity and the value of the individual, can learn much from the way medicine acts concretely in treating the individual person with gentleness, compassion and concern—can learn many indispensable lessons in applied idealism. Medicine can well say to religion "Beware of the arteriosclerosis of dogma and the dangerous bacteria of sectarian pride. Be on guard against every retreat from reason into uncritical and uncriticized faith."

At the same time we of religion can and must say to the spokesman of science "Beware of self complacency and the idolatry of the partial. Do not make the mistake of dismissing all of religion because some of it is primitive, superstitious or untenable. Do not succumb to the genetic fallacy." The doctor by virtue of his absorption in the specific and the concrete ofttimes ignores the Wider Context of the universe. Prophetic religion must remind the scientist that the sources of salvation and of healing in the world—the sun, the earth, the food and the herbs of the earth as well as the intellect of man and the instruments fashioned by that intellect—are basically not man's creation. They are made available to us by the Creative Power, God. We today can accept no infantile conception of Deity. At the same time men of science are hopelessly arrogant and tragically parochial when they try to ignore or deny the Creative Power working in and through us, revealing Himself in the restless mind of man and the law-abiding majesty of nature. When we rebel against Him it is after all with His weapons of intellect and of conscience that we revolt; when we try to flee from God it is actually on His created carpet of law and of causality that we escape.

Sermon delivered at the Centennial religious service, Ninety Sixth Annual Session of the American Medical Association, Atlantic City, N. J., June 8, 1947.

True, there are fundamental differences between science and religion in area of interest and in universality of outlook. Science stresses tentativeness, analysis and the realm of fact; religion emphasizes commitment, purpose, synthesis and value. Science often can tell us how to get what we want; religion at its noblest reminds us about what we ought to want, giving us an ultimate feeling of relatedness to a Divine Mind and Purpose, a supreme loyalty to the rational good.

At the same time prophetic religion and scientific medicine are bound together by many great ties. We both recognize how frail man is—man a broken reed at times, a bent reed at other times but a "thinking reed" blessed by God with the capacity to reason, to explore, to experiment, to create. Religion and medicine join hands at the moment of birth, the majesty and mystery of new life and also in the poignant hours of death when the thread of existence is severed by the inexorable scissors wielded by the Angel of Death. Religion and medicine in their truest moments are humble in the recognition that the blessings and the healing resources of the universe are not invented by us human beings but discovered and used by us and that whether we admit it or not we are always dependent on the Power greater than ourselves. Finally, religion and medicine are united in a sense of commitment and consecration to the service of life.

SPIRITUAL SIGNIFICANCE OF MEDICINE

At this time of the celebration of the hundredth anniversary of the American Medical Association it is fitting and proper for us to reflect on the spiritual and psychologic significance of medicine in this time of crisis, to consider the dangers ahead and also the tasks ahead.

What is the spiritual and psychologic significance of medicine? I see it in three dimensions: as hope for human life, as the symbol of progress, as the moral challenge to the nations of the earth. I see medicine as the Attorney for the Defense of man, as the antidote to despair and pessimism in our age—a pessimism reflected in the poetry of an Auden, the Existentialism of a Sartre, the novels of a Kafka. The doctor knows all of the evils and brutalities of life, but he is the eternal champion of Eros against Thanatos, the life-wish against the death-wish. Medicine carries on a constant warfare with germs and bacteria, virus infections and degenerative diseases. The High Command of medicine is to be found in the laboratory amidst the retorts and the test tubes; its line officers are to be found in every hospital and clinic working to conquer new territory for the kingdom of life. Let us listen to no premature elegies for our human species, for medicine by its deeds is the spokesman of hope, proving that man is something more than self centered and selfish, that there is an altruistic component in the human heart and that human nature is capable of rationality, objective analysis and a continuing conquest of the enemies of human survival, both external and internal. The doctor is the symbol of man as the doer, the searcher, the life giver.

Medicine, in the second place, is a symbol of progress. Carl Binger in his provocative work "The Doctor's Job" makes very vivid this truth of progress which we tend to overlook in our skeptical age. Just fifty years ago there was no x-ray, no Wassermann test; vitamins were unheard of; typhoid and diphtheria were still an enormous menace; there was no radium. What undreamed of vistas of achievement scientific medicine has opened up within these last few decades! Realistically we dare to hope for a time when cancer will go the way of typhoid, when many of the degenerative diseases will come under the control of man as tetanus has come under his control. A generation that has discovered penicillin and sulfanilamide and that now has at its disposal radioactive substances unheard of ten years ago can find in medicine the antibiotic to human despair, the assurance of human progress.

There are many new frontiers for medicine in the conquest both of physical and of mental disease. Psychosomatic medicine is one of those great new frontiers. It is imbued with the spirit of Paracelsus, "He who wants to know man must look upon him as a whole." The spirit of psychosomatic medicine is quite close to that of the religion of Judaism, which always looked on man as an interwoven unity of body and soul, . . . convinced that it is impossible to tell where the body ends and the soul begins. Religion and medicine must both become concerned with the whole man today. It is no secret that in our tense and complex age millions of human beings are suffering not only from dislocated bones but from dislocated emotions, minds and souls. The war has educated all of us to the enormous role that emotions play in the psychic economy of the world. Indeed, until men learn how to manage their emotional life artistically there will be neither peace nor justice in the world at large, nor health and tranquillity in the organism at home. The words of Shakespeare "Anger's my meat; I sup upon myself and so shall starve with feeding" apply in one degree or another to multitudes everywhere. Anger or hate, grief or loneliness are the meat of life for millions of uncertain, frustrated human personalities; many do sup upon themselves and starve themselves into asthma and hypertension and many of the other ills that flesh is heir to.

As psychosomatic medicine and group therapy advance and thousands of doctors become trained in the newest insights of psychiatry and psychoanalysis we shall learn how to cure these "toothaches in the heart" of man—the toothache of repressed anger, frozen love, congealed emotion, embittered cruelty—learn also to take away many of the pains of inner conflict and to sew together with the surgical needle of the understanding mind the gaping and open wounds that life inflicts upon us all. Such a medicine will parallel the great strivings of religion at its best to make man mature, integrated, inwardly tolerant, free of corrosive self contempt, liberated from the inner Egypts of cruelty and callousness and able through such emotional maturity and psychic independence to become a genuine co-worker and collaborator with God. Medicine not speculating about the *problem of evil* but working restlessly with the *evil of problems* is today truly a symbol of human progress.

In the third place medicine is a moral challenge to the nations of the world. It looks on sick men not in order to condemn them but to understand and to cure them. So should we look on sick nations in the world. The therapeutic intent of medicine which has worked miracles should become the therapeutic intent of statesmanship. Furthermore there are no narrow national sovereignties in the discoveries of the medical clinic. In medicine there truly is "one world." There just is no Chinese insulin or American penicillin. There is the same insulin and the same penicillin for the human family everywhere. Furthermore there can be no real isolation in science because its truth can be verified only by being shared. Doctors trained and molded by the tradition of their profession have learned the art of cooperation, seeing that truth yields up its secrets only through collaborative team work. There is a universality about the healing process which applies equally well in China or Russia, Britain or America; there are no frontiers dividing truth from truth. What medicine has been able to achieve it has done through the free intellect, the boundaryless laboratory, the creative interchange of ideas, the humble sharing and cooperative interrelationship of men of all nations, races and creeds. Medicine is William James's "moral equivalent for war" . . . it is the sublimation of selfishness and self centeredness into an immortal and worldwide quest and attainment of healing truth. The nations of the world can learn a moral lesson from medicine—that just as the healing drugs of one city or one nation know no limited sovereignty but are to be made available to the human family everywhere, so the healing laws of peace and order must apply everywhere under world sovereignty and world government.

THE DANGERS AHEAD

There are enormous dangers ahead for religion and for medicine; the danger of religion succumbing to a rigid dogmatism or a pride in the vested interest of ideas inherited from the past; of medicine succumbing to an idolatry of its own technics, a worship of a part of life as the whole of life, a blind unwillingness to see the wider context of Divinity in the world. There are dangers that confront the whole human enterprise. The world is going to have to become better than it has ever been or there will be no world. Many of the luxuries we have afforded in the past we can afford no longer—the luxury of prejudice, hatred and war. The choice is really before us; *will it be the isotopes of healing or the radioactivity of death?* If humanity cannot take a lesson from the pages of medical science, of compassionate and courageous doctors concerned not with death but with life, then we and our children do not deserve to survive.

THE TASKS

There are not only great dangers but great tasks ahead. In the increasingly interdependent society of our age we are going to have to plan for abundance, for health, for equality. The basic question is whether it is going to be voluntary planning or compulsory planning. The medical profession in the degree that it wishes to avert and to avoid coercion from without will certainly have the wisdom to plan voluntarily for adequate treatment of all Americans irrespective of status or class. A democratized medicine, like a democratized religion, is one of the prerequisites of our vast industrial society. We need new insights today into the enormous influence of a frustrating environment and all of the traumas of unemployment and poverty and ruthless economic competitiveness on the plastic material of the human spirit. We need doctors and religionists filled with the spirit of the American poet Walt Whitman: "I know that all men ever born are my brothers . . . in all people I see myself. . . . I will not have a single person slighted or left away. . . . I do not ask the wounded person how he feels. . . . I myself become the wounded person. Behold I do not give lectures or a little charity. When I give, I give myself. Whoever degrades another degrades me. . . . By God, I will accept nothing which all cannot have their counterpart of on the same terms."

This is the spirit which animates the true physician. In his feeling of relatedness and concern for his patient the doctor does not give lectures or a little charity, he gives himself. He has a kind of empathy which makes him feel his essential oneness with the suffering and sensitive human family.

The equality and brotherhood of mankind which both religion and medicine proclaim are made vivid in a remarkable passage from an ancient Hebrew manuscript. An old rabbi asks the question "How can we love the Lord our God with all our heart and soul and might when we can never see God, the invisible spirit of the universe? We can love God best by loving His letters best. Just as a child learns the alphabet one letter at a time and then combines the letters into words and the words into sentences until at last he is able to read a book, so should we regard every human being as but one letter in the alphabet of God. The more letters we come to understand and to treasure, the more we can read the Book of God and love its Author."

That ancient rabbi teaches us that the true meaning of life is to be found in this test: "Man, do you by your cruelty or callousness blur the letters of God or even erase them, or do you by your compassion learn to treasure the letters of God, your fellow human beings?"

This magnificent parable from Jewish literature certainly applies to medicine and to religion in the world of today. Some wonderful human letters are blurred by bigotry and even erased by discrimination. Religion, if it means anything in human life, must battle ceaselessly against walls and bricks of prejudice, and the medical profession must learn to demolish all barriers and obstacles placed in the way of human talent, frustrated and denied educational fruition because of color or race or creed.

Religion when true to its prophetic heritage does treasure the letters of God by investing every man with dignity as a child of the Divine. We also know that the surgeon, the doctor, the psychiatrist polishes and preserves the consonants of divinity—human beings, men, women and children—by making these letters glow luminously with health, integration, maturity. Religion and medicine must both come to value every person on earth as an equal consonant in the vocabulary of Divinity.

It is characteristic of prophetic religion that it emphasizes the Messianic dream—the hope of a world redeemed from evil and purged of iniquity and freed of all the barnacles of pain and disease, a world that will become one as God is one. How far we still are from that Messianic Kingdom! We who live in this twentieth century recognize that there are no absolute answers but only partial victories; yet these victories are good omens of a nobler and freer future when the letters of God on earth will not be blurred but rather will be burnished with love and with understanding. The laboratory and the sanctuary can become allies and creative partners in helping to bring a little nearer that age of the Divine, by learning to work together with mutual respect, mastering together the new secrets of nature and of human nature, laboring together in the words of an ancient Hebrew hope and prayer "for the blessing of all and the hurt of none, for the joy of all and the woe of none."

Amen.

CAESAR, GOD AND MEDICINE

Rev. RALPH COOPER HUTCHISON
Easton, Pa.

The absurd paradox of this era is constituted by the prodigious achievements of medicine on the one hand and the destructive fury of war on the other. That such miracles should be performed in the alleviation of human suffering and the preservation of life while war spreads disease and death is a fateful coincidence that deserves deep study and thought. To the physician or surgeon who exerts all of his skill and strength for the preservation of some precious life, it must be ironic to realize that within our own time two nations, Russia and Germany, have each planned deliberately and carried through successfully the tortured destruction of an estimated five million of their own finest citizens. Add to this the smaller slaughters in smaller nations and then the crippling, the diseasing, the maiming, the blinding and the killing of an incalculable number in history's two greatest wars, and medicine's mighty effort is dwarfed in comparison.

War, I think, should be recognized by the medical profession as humanity's worst disease. With world inclusive precision it systematically destroys life. It maims, it blinds, it disfigures. It starves whole peoples and leaves them subject to the disease which follows undernourishment. In a day it destroys the sanitary and health facilities created by the labors of a generation. Taking men of the finest health it places them in prison camp and slave labor subject to the primitive ravages of every disease known. And it reaches to their minds and destroys the faith and hope and sanity on which health must be based.

This disease of war is more widespread than our hospitals and our health measures. It literally covers the face of the earth. Its force is inexhaustible. At times and most of the time it is supported by more governmental funds in a few weeks than has medicine been given in all modern history. It commands the devotion and efforts of more men in one generation than have served medicine in all recorded history.

War is the arch enemy of medicine and of civilization. International war must be stopped and its increasing cadence must be retarded or the magnificent achievements of medicine will come to a brutal futility. The ghastly dichotomy of medicine on one hand and war on the other cannot go on forever. One must triumph—either medicine and civilization or war and barbarism.

If there is any profession in the world to whom the outcome of this struggle is vital, it is to yours. If any sermon is to be preached to medicine, it is this for the preservation of the life and health of mankind.

I

International war can be stopped, but not by the methods which we have used since 1914. These methods give priority to negotiation, arbitration, treaties, compromises and appeasement. They are sincere and even scholarly attempts to eliminate war by eliminating the causes of war. But at the same time they deliberately avoid the issue of war itself. They are expedients by which leading and democratic nations evade their own lonely responsibility of stopping this worst disease of history.

Far from the madding crowd of statesmen, politicians and diplomats and within this group isolated in its practical science let us review this problem reasonably. When a criminal maniac breaks loose and begins to slaughter people, we do not call a conference to study the social and hereditary factors out of which developed his murderous fury. Nor do we begin delicate negotiations with him. Nor do we strive to appease him. We stop him dead in his tracks by any means possible. After he is stopped we return to the conference table and the research problem to devise methods by which the development of such criminals may be prevented in the social order.

In the world of international relations this is exactly what we have refused to do since 1914. Through courts of international justice, through treaties, concessions and appeasements, through leagues of nations of one kind or another we have striven to eliminate the conditions out of which rise wars. And under cover of these benevolent measures we have excused ourselves and evaded our responsibility to stop war. While afraid to go out and stop the criminal we have rationalized our cowardice by vigorous debates on the cause and cure of crime.

We could have prevented this last world war. We know that now. Had we or England or France sent one squadron in that direction when a rebellious Japanese army invaded Manchuria, had one regiment been moved when China was invaded, had one nation showed fight when Italy invaded Ethiopia, had one democracy strapped on its arms when Germany and Italy invaded Spain, had any nation started to move its forces when Hitler marched into the Rhineland, that developing world war would never have started. It could have been decisively and easily stopped at any of those points. But the democracies were afraid to lead out and to stop war.

International war has been stopped before when great democracies chose to do so. Two brilliant pages in history record those achievements, and both came when nations were willing to assume responsibility. The first and the greatest perhaps in all history was under the leadership of Jefferson, Madison and Monroe, when the then little nation composed of these states decided to stop for all time any international European war on this continent. They did not do so by leagues, appeasements or treaties. They simply stopped war. They announced to the world that European wars on this continent were all over, that there would be no more. And, small and weak as they were, they meant it—and incidentally we still mean it. And European international war on this continent was stopped forever.

It was done another time. This was in the Pax Brittanica, the hundred years of international peace from 1815 to 1914 enforced by Britain for its own purposes. No wars were permitted save trifling ones to which it had no objection. Had the German navy not grown strong enough to challenge the British navy, no one knows how long that peace might have been further maintained by Great Britain.

Now, America can prevent all international war. We have the strength and position. We can if we will step out and proclaim an imperialism of peace and freedom. We can announce that every nation is to stay within its own borders and that, whenever one force invades or attacks another for purposes of con-

---

Abstract of the sermon which Rev. Ralph Cooper Hutchison, president of Lafayette College, Easton, Pa., delivered at the Centennial religious service, Ninety-Sixth Annual Session of the American Medical Association, Atlantic City, N. J., June 8, 1947.

quest, we will loose everything that we have from funds to bombs to stop that attack or that invasion. We cannot solve all of the problems of the world. We cannot bring justice between nations. We cannot assure economic fair play. These may in time be achieved by the United Nations. But we can stop war and, if we will stop war, then the forces of civilization may do their work and eventually eliminate the causes of war.

II

The immediate reaction to this is that such a problem is a political one, that men of the medical world must do their own highly specialized work and that this must be cared for by the statesmen and the politicians. The suggestion that the medical profession should do something about a political problem is open to considerable debate. But that medical men should do something about this and other political and religious problems, I wish to urge.

One of the major problems of democracy has developed in this age of high specialization and lies in the failure of highly trained specialists to take their part in democracy and in religion. The first deals with the organization of men. The second deals with their driving motives and convictions, and both fail unless the ablest and most mature minds participate in full force. The specialist, the scientist, the engineer and the physician are now taking the position that they must carry on their own significant work and must leave government and religion both to the professionals within those fields. As a result, the nonparticipation of medical men in the responsible work of both church and state is notorious.

The reasons for this are understandable. It might seem wrong that one so highly trained and superbly equipped as for medicine should allow any time or strength for church or government. This hard acquired skill, this priceless knowledge needs its fullest use in the saving of health and life. Furthermore, the very narrowness of medical education and its complete concentration on the scientific leaves the medical man feeling unqualified for active participation in the fields of religion and government. Humanistic studies having to do with the basic problems of human relations and with the thinking and motives of men—such studies are almost totally excluded from the college and professional education of medical men. Thus the medical profession, confident in the field of its own skill, hesitant in politics and religion, resolves to let others carry these social responsibilities.

But, curiously enough, neither democracy nor religion can function if left to mercies of their own professionals. Their problems are universal. They affect every man, woman and child. They affect every aspect of man's welfare, of his thinking and of his conscious existence. The problems are too great for any one group. The rich cross breeding of thought and the broad strength of men of great skills and knowledge in other areas are needed in these. Democracy will not survive if you who are the specialists do not share the labors of democracy. It cannot stand and fight for human rights if the specialists of our era remain in their laboratories, in their shops, in their hospitals and clinics and studies. We cannot win in democracy and for democracy if our increasing army of specialists fails to take its share in our social and international tasks.

Many old battles have now to be fought again. We thought that certain victories had been won. There is this battle for peace which we once thought was won. There is the battle against barbarism which must be fought anew. There is the issue of human slavery, which has returned like a plague over the earth. There is the great issue of religious liberty, now denied in nation after nation. There is the struggle to maintain a Christian civilization and the Christian ideal in life.

And there is a time when the preacher must lay aside his Book, the lawyer his gown, the teacher his rule and go out and share the human task of religion and government. By that same token there must be times when the new scientist of this day must aid, when the engineer must lay aside his plans, the technologist his microscope, the surgeon his gown and take full part in the task of Christian civilization.

Perhaps the words of Christ could, this day, have a special meaning for the medical profession, a meaning not quite what he intended when he said

Render, therefore, unto Caesar the things that are Caesar's and unto God the things that are God's.

Council on Pharmacy and Chemistry

REPORT OF THE COUNCIL

The Council has authorized publication of the following statement.

Austin Smith, M.D., *Secretary.*

METHADON, GENERIC TERM FOR 6-DIMETHYLAMINO-4,4-DIPHENYL-3-HEPTANONE

In view of the fact that the term Amidone, which has been applied to the chemical 6-dimethylamino-4,4-diphenyl-3-heptanone, seems to have proprietary restriction, the Council in cooperation with several interested pharmaceutical manufacturers and investigators gave consideration to the coining of a generic or nonproprietary name for the compound. Various proposals were received from those concerned, and eventually the term Methadon was agreed on.

As a result of the foregoing consideration the Council voted to recognize the word Methadon as the generic designation for 6-dimethylamino-4,4-diphenyl-3-heptanone.

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

Austin Smith, M.D., *Secretary.*

BISMUTH AND POTASSIUM TARTRATE (See New and Nonofficial Remedies, 1946, p. 250).

The following dosage form has been accepted:

Brewer & Company, Inc., Worcester, Mass.

Bismuth and Potassium Tartrate: 2 cc. ampuls. Each ampul contains bismuth potassium tartrate 50 mg. with benzyl alcohol 0.04 Gm.

ESTROGENIC SUBSTANCES (WATER SOLUBLE) (See New and Nonofficial Remedies, 1946, p. 447).

The following additional dosage form has been accepted:

Ayerst, McKenna & Harrison, Ltd., New York

Tablets Premarin: 2.5 mg.

HOSPITALS AND THE GENERAL PRACTITIONER

At the centennial meeting in June in Atlantic City the Council on Medical Education and Hospitals presented a supplementary report to the House of Delegates reviewing the policy of the Council, of the Advisory Board for Medical Specialties and of the House of Delegates on the appointment of general practitioners to hospital staffs. The Board of Trustees requested that copies of this report be transmitted to the various hospital associations and to each hospital registered by the Council, and that is being done this week in accordance with the Board's request.

This report of the Council [1] takes note of the fact that certain hospitals have established a policy of limiting staff appointments to physicians who are certified by specialty boards or who hold memberships in certain special societies. The report emphasizes that such a policy is contrary to the principles of the Council on Medical Education and Hospitals and appears unsound.

The Council's statement points out that the House of Delegates in 1946 approved a resolution encouraging hospitals to establish general practitioner services and specifically stating that the creation of general practitioner services would not prevent hospitals from being approved for the training of interns or residents.

To clarify this action further the Council requested authority to amend that section of "Essentials of a Registered Hospital" which deals with the establishment of staff sections so as to include specific mention of general practice sections. This amendment was approved by the House of Delegates and the amended "Essentials of a Registered Hospital" is being distributed with the reprints of the supplementary report.

The Council's report and its endorsement by the House of Delegates should make clear beyond question to the boards of trustees and directors of hospitals that any rule barring a physician from staff privileges because he does not possess a certificate from one of the specialty boards or membership in a special society is not in accord with the expressed policy of the American Medical Association and the Advisory Board for Medical Specialties. Hospital staff appointments should depend on the qualifications of physicians to render proper care to patients as judged by the professional staff of the hospital and not on certification or special society membership.

No fixed views exist at present as to what regulations should be established for general practice sections or for the activities of general practitioners in other hospital sections. This is a problem in which local conditions must be carefully weighed and the results of intelligently planned experiments studied. Clear thinking and unselfishness on the part of both specialists and general practitioners will be needed in devising workable programs.

In general it would seem reasonable that general practitioners should be extended privileges in the various departments of a hospital in accordance with their personal ability as judged by the heads of the different sections or by a committee of the staff. A paper on how a general practice section has operated over a period of eight years in one large general hospital was recently published in The Journal.[2] Reprints of this article are being distributed with the supplementary report.

Those most concerned that adequate provisions be made to preserve access to hospitals for general practitioners realize that in many instances university hospitals or institutions designed for special purposes may not be able to establish general practice sections. Such hospitals, however, account for only a small fraction of the total hospital beds in this country.

It is likewise accepted that preserving a place on hospital staffs for general practitioners is not a disavowal of the efforts of physicians, administrators and trustees to make our hospitals centers for providing the highest quality of medical care. The objective is to prevent competent physicians from being denied for arbitrary, unsound reasons the right to practice medicine in hospitals. The extension of staff membership to qualified general practitioners should serve as a stimulus to every general practitioner to maintain the quality of his work at the highest level.

The statement of the Council and the action of the House of Delegates should have a beneficial effect in restoring balance and clear thinking to a situation which has become distorted and confused in several regions in this country.

IMMUNITY IN SYPHILIS

A new approach toward understanding the nature of immunity in syphilis will be possible, according to Urbach and Beerman,[1] if further study confirms the preliminary demonstration of complete sterilization by penicillin therapy of animals experimentally infected with syphilis and of syphilitic pregnant women. Human beings do not possess natural resistance to syphilis. Immunity to syphilis develops in man as a result of syphilitic infection. The development is gradual and never proceeds as far as that of most of the other immune reactions of human beings. Experiments demonstrate that syphilitic immunity in susceptible animals develops slowly. During the early phase of the infection the untreated rabbits are wholly receptive to a second infection. After the ninetieth day there is evidence of partial immunity, so that the animals no longer develop chancres in response to reinoculation. Where the infection is eradicated by drug therapy before any immunity has had time to develop, that is, in the early stages, the animals react with formation of chancre when reinfected, because the intensive treatment in the early stages of infection serves to check the invader and thus indirectly prevents the development of active immunization: the latter can arise only in a thoroughly infected body. Energetic treatment in the late stages will protect the animals against reinfection.

Chesney[2] believes that animals treated in the late stages are biologically cured and at the same time actively immunized because they were thoroughly infected for a sufficiently long time. Kolle denies that these animals have really been cleared of the infection, claiming that they harbor an asymptomatic superinfection as shown by positive lymph node or organ transfer test if performed a sufficiently long time after the last administration of chemotherapy. Since penicillin can apparently effect a speedy cure of syphilis and is at the same time rapidly eliminated from the organism, future experiments might be tried with the aid of this new spirocheticidal agent. The reinoculation test, according to Urbach and Beerman, can hardly constitute a reliable criterion of cure in treated animals. We can only depend on the infectivity of tissues removed from treated animals at appropriate intervals after cessation of treatment and inoculated into normal animals.

Immunity in a syphilitic person is never at any stage of the disease absolute but only relative. Therefore the idea of achieving active immunization in syphilitic persons by administering virulent spirochetes must be discarded; any such attempts are likely to be dangerous. Untreated infection with syphilis confers on the human being immunity which prevents natural superinfection but does not protect against massive artificial superinfection. This immunity is not strong enough to defend the organism against recurrent blood borne thrusts of the primary infection. Intensive treatment of early syphilis is in all probability capable of curing the disease. While such treatment simultaneously abolishes all immunity that is in the process of developing, it does not endanger the patient if it is strong enough to eradicate the infection completely. But if antisyphilitic therapy is inadequate to sterilize the body, the organism's natural defensive mechanism will be seriously impaired. This means that the patient is left both without cure and without defense, a situation often leading to neurorecurrences, therapy resistant cutaneous relapses and precocious tertiarism. A patient may be completely cured and yet remain refractory to natural reinfection. Even in patients treated early, reinfection does not necessarily mean that the first infection has been completely eradicated; theoretically, at least, superinfection may have occurred because, as Moore[3] points out, adequate methods of differentiating between the two are not available.

Chesney likewise stresses that a small amount of treatment in early syphilis is worse than none because it interferes with the body's own defensive mechanism, while at the same time it often fails to eliminate the infection. It leaves the patient worse off than nature alone would have left him and is therefore to be condemned.

Urbach and Beerman regard immunity as a special aspect of allergy. The entire course of syphilis may be explained on the basis of allergy. The reaction of the organism to reinfection also suggests an allergic mechanism. Thus Chesney points out that the destructive character of tertiary lesions is due to the fact that the body has changed its way of reacting toward the spirochetes and now behaves in a much more violent fashion. It has become hypersensitive or allergic, which is another way of saying that a small charge of spirochetes is now capable of setting off a considerable explosion of tissue reaction. Attempts to develop a method to determine the allergic state of a syphilitic individual have thus far been unsuccessful. Details of the mechanism of the defensive reaction against syphilis are still unknown. It is definitely not humoral but is probably a tissue or cellular reaction. The existence of antibodies against syphilis has not been demonstrated. The relationship of the positive serologic reaction to the organism's capacity to produce antibodies against spirochetes is not clear, and numerous attempts to induce active or passive immunization against syphilis in man and animals have to date failed to produce any significant results.

Current Comment

CONTROL OF INTERFERENCE CAUSED BY DIATHERMY EQUIPMENT

More than ten years ago the Federal Communications Commission was requested by radio communication agencies to formulate regulations to control the interference caused by diathermy equipment. On May 9 1947 the commission released Public Notice number 7722, which document assigned three frequency channels for medical diathermy. The channels are 13.66, 27.33 and 40.98 megacycles in arithmetic progression and correspond to wavelengths of 22, 11 and 7½ meters, respectively, in harmonic progression. The widths of the channels are approximately 15, 320 and 40 kilocycles. Radiations from frequencies other than those specified shall be suppressed so that radiation does not exceed a strength of 25 microvolts per meter at a distance of a thousand feet or more from the diathermy equipment causing such radiation The commission pointed out two methods for operating diathermy apparatus in order to comply with these rules for equipment manufactured after July 1, 1947. The first method is to operate within assigned frequency bands using equipment either "type approved" or certified by a competent engineer. The second method is to operate on any frequency, provided the equipment is enclosed in a shielded room with a filtered power supply and that all radiation on any frequency is limited to 15 microvolts per meter at a distance of 1,000 feet or more from the diathermy equipment. Operation in this manner also requires certification by a competent engineer. A physician owning and operating a diathermy apparatus manufactured prior to July 1, 1947 may continue to operate for a period of five years, provided the equipment does not interfere with authorized radio services. If interference is reported, the physician is responsible for eliminating the disturbance to radio communications. This may be accomplished in some instances by readjusting the existing diathermy appliance. If no means can be provided to eliminate the interference, the physician becomes subject to the new rules and regulations. That is, he must screen his present apparatus or acquire frequency controlled equipment. The channel 2,450 megacycles has been assigned, corresponding roughly to 12.2 cm. wavelength. A channel in the neighborhood of 6 megacycles will be announced later Frequencies of 915, 5,850, 10,600 and 18,000 megacycles have also been allocated for industrial, scientific and medical use. At present the commission has not found it necessary to make any rules applicable to surgical diathermy. The medical profession and the manufacturers of diathermy apparatus are to be congratulated on the successful cooperation with the Federal Communications Commission and the representatives of radio industries on reaching a solution of this perplexing problem in the field of radio communications and diathermy.

CONTROL OF VITAMIN D MILK

In 1933 the Council on Foods and Nutrition for the first time granted acceptance to bottled fresh milk fortified with vitamin D. Since then the number of dairies that have applied to the Council for such consideration is legion. In order for dairies to secure the Seal of Acceptance of the Council they are required to declare on their label or bottle caps the source and unitage of vitamin D and must have their advertising copy approved by the Council. In addition, at least twice yearly, proof must be submitted to the Council in the form of bioassay reports attesting that the milk has been assayed by a reputable laboratory and found to be up to the required potency of 400 units of vitamin D per quart. While a large number of concerns that sell vitamin D milk employ the Council's Seal and abide by the regulations set forth, purveyors of vitamin D concentrates sometimes sell their wares without mentioning the need for routine control to assure the physician and the lay public that proper potency is being maintained. Unless state, municipal or Council regulations require periodic checkups for the vitamin D content of milks, none, apparently, are made. Such large cities as Chicago, Cleveland, Detroit, St. Louis and New York require frequent tests. So far only five states have regulations governing vitamin D milk and have made provision for testing such milks biologically. They are Connecticut, New York, Kentucky, Virginia and Wisconsin. In view of the fact that vitamin D milks are now depended on by physicians to supply vitamin D, it might be well for doctors to inquire of their local or state health departments as to whether or not such milks are subjected to routine control and whether or not such regulations exist for the protection of the public and the medical profession.

THE LATEST REVISION OF THE UNITED STATES PHARMACOPEIA

The thirteenth revision of the United States Pharmacopeia has been published and is now available for all who are interested in official standards and rational drug therapy. This revision became official in the United States on April 1, 1947. Indispensable to pharmacists, drug manufacturers, teachers of medical students and many others, it serves also as an interesting guide to changes in therapeutics. Now revised every five years, the United States Pharmacopeia includes in each revision new monographs, omits others, and in general provides a reference source that should be familiar and handy to the entire medical profession. The letters "U. S. P." inspire confidence in drugs to which they are appended; they indicate a degree of standardization that is acclaimed the world over. An example of such wide recognition is the fact that the book is also official in several Latin-American countries. The present edition is especially worthy of commendation. Those who participated in its preparation have a good reason to be proud of a job well done.

ORGANIZATION SECTION

Official Notes

MIDWINTER (SUPPLEMENTAL) SESSION OF AMERICAN MEDICAL ASSOCIATION

After careful investigation of the availability of accommodations for a midwinter (supplemental) session of the American Medical Association in the short time at its disposal, the Board of Trustees selected Cleveland as the place of that session, since the accommodations for meeting places and for sleeping rooms seemed to be adequate and a convenient time seemed to be open. The midwinter session will therefore be held in Cleveland, Jan. 5 to 8, 1948, the first two days being devoted to a session of the House of Delegates and January 7 and 8 to General Scientific Meetings devoted exclusively to the general practitioner.

The Scientific Meetings, the Scientific Exhibit and the Technical Exposition will be housed in the Cleveland Auditorium, but the place of meeting for the House of Delegates has not yet been selected. The Council on Scientific Assembly, in cooperation with the Board of Trustees, will prepare the program for the Scientific Meetings.

Information concerning hotel reservations will be published as soon as arrangements concerning this matter have been completed.

ANNUAL CONFERENCE OF SECRETARIES AND EDITORS

The Board of Trustees has selected Nov. 7 and 8, 1947 as the time for the Annual Conference of Secretaries and Editors, which will be held at the headquarters in Chicago, starting at 10 a. m., Friday, November 7. The program for this conference will be announced at a later time.

Washington Letter

(From a Special Correspondent)

Aug. 20, 1947.

Compton Says President Was Poorly Advised on Science Bill

Karl T. Compton, president of the Massachusetts Institute of Technology, declared President Truman was "poorly advised" in vetoing the National Science Foundation. Commented Dr. Compton "Practically every one agrees that the universities and colleges cannot contribute their part in meeting the postwar scientific needs of the country on their prewar basis of financial support. Every one knows that national security and prosperity require assiduous attention to science and the training of scientists. I believe the President was poorly advised in this action. I believe the value to the nation of getting the program going promptly outweighs the objections to the form of the bill, which could be corrected later, if in practice they proved serious."

Major General Hawley Expected to Head Veterans Administration

Major Gen. Paul R. Hawley, medical director of the Veterans Administration, is expected to succeed Gen. Omar N. Bradley as head of the Veterans Administration when Bradley reportedly will leave the agency in sixty days to became army chief of staff. He is now on a tour of army installations in Europe. Others mentioned are Major Gen. Lewis B. Hershey, former Selective Service chief, and Major Gen. Harry K. Vaughan, personal military aide to the president. As reasons for which Hawley is favored are his success in medicine and as an administrator under Bradley, his success as head of army medical service under combat conditions in Europe, his experience with enlisted men and veterans and reported presidential fears that General Vaughan's appointment might be opposed in the Senate by political opponents. Dr. Hawley is reported to be General Bradley's choice for the post.

European Women Visit Institute of Health

Among six European professional women who were guests at the National Institute of Health at Bethesda during a Washington stopover on their trip to the conference of the International Federation of University Women in Toronto were Miss Regine Aernouts, head pharmacist of St. Elizabeth Hospital, Antwerp, Belgium; Miss Tine Quist, pharmacist at Leiden University and Dr. Marguerite Steiger, chemist in a Zurich laboratory.

Coming Medical Meetings

American Academy of Ophthalmology and Otolaryngology, Chicago, Palmer House, Oct. 12-17. Dr. W. L. Benedict, 102 Second Ave. S.W., Rochester, Minn., Secretary.

American Anti-Arthritis Association, Del Mar, Calif., Oct. 4-5. Dr. Robert T. Pottenger, 65 N. Madison Ave., Pasadena, Calif., Secretary.

American Association of Medical Record Librarians, New York, Hotel Commodore, Sept. 7-12. Mrs. Adaline Hayden, 18 E. Division St., Chicago, Executive Secretary.

American Association of Obstetricians, Gynecologists and Abdominal Surgeons, Hot Springs, Va., The Homestead, Sept. 4-6. Dr. James R. Bloss, 418 Eleventh St., Huntington 1, W. Va., Secretary.

American Clinical and Climatological Association, Colorado Springs, Oct. 13-15. Dr. James Bordley III, Johns Hopkins Hospital, Baltimore 5, Secretary.

American College of Surgeons, New York, Waldorf-Astoria Hotel, Sept. 8-12. Dr. Paul B. Magnuson, 40 E. Erie St., Chicago 11, Secretary.

American Congress of Physical Medicine, Minneapolis, Hotel Radisson, Sept. 2-6. Dr. Richard Kovacs, 2 E. 88th St., New York 28, Secretary.

American Congress on Obstetrics and Gynecology, St. Louis, Municipal Auditorium, Sept. 8-12. Mr. Karl S. Richardson, 24 West Ohio St., Chicago, Business Manager.

American Hospital Association, St. Louis, Sept. 22-25. Mr. George P. Bugbee, 18 E. Division St., Chicago, Exec. Secretary.

American Public Health Association, Atlantic City, Oct. 6-10. Dr. Reginald M. Atwater, 1790 Broadway, New York 19, Executive Secretary.

American Roentgen Ray Society, Atlantic City, Sept. 16-19. Dr. H. Dabney Kerr, University Hospitals, Iowa City, Secretary.

Central Neuropsychiatric Association, Galveston, Texas, Oct. 17-18. Dr. William C. Menninger, 3617 W. Sixth Ave., Topeka, Kans., Secretary.

Colorado State Medical Society, Denver, Shirley-Savoy Hotel, Sept. 17-20. Mr. Harvey T. Sethman, 1612 Tremont Place, Denver 2, Executive Secretary.

District of Columbia, Medical Society of the, Washington, Oct. 6-8. Mr. Theodore Wiprud, 1718 M Street N.W., Washington 6, Secretary.

International Cancer Research Congress, St. Louis, Hotel Jefferson, Sept. 2-7. Dr. Axel N. Arneson, 510 S. Kingshighway, St. Louis, Chairman Committee on Local Arrangements.

International College of Surgeons, U. S. Chapter, Chicago, Palmer House, Sept. 29-Oct. 2. Dr. Louis J. Gariepy, 16401 Grand River Ave., Detroit 27, Secretary.

Kentucky State Medical Association, Louisville, Sept. 29-Oct. 2. Dr P. E. Blackerby, 620 S. Third St., Louisville 2, Secretary.

Michigan State Medical Society, Grand Rapids, Pantlind Hotel, Sept. 23-26. Dr. L. Fernald Foster, 2020 Olds Tower, Lansing 8, Secretary.

Mississippi Valley Medical Society, Burlington, Iowa, Oct. 1-3. Dr. Harold Swanberg, 510 Maine St., Quincy, Ill., Secretary.

Nevada State Medical Association, Reno, Sept. 4-6. Dr. Moreton J. Thorpe, 17 N. Virginia St., Reno, Secretary.

Oregon State Medical Society, Portland, Sept. 4-6. Dr. Thomas S. Saunders, 1020 S. W. Taylor St., Portland 5, Secretary.

Pennsylvania, Medical Society of the State of, Pittsburgh, Hotel William Penn, Sept. 15-18. Dr. Walter F. Donaldson, 500 Penn Avenue, Pittsburgh 22, Secretary.

Southeastern Dermatological Association, Knoxville, Tenn., Hotel Andrew Johnson, Aug. 31. Dr. A. H. Lancaster, 608 W. Main Ave., Knoxville, Secretary.

Southern Psychiatric Association, Birmingham, Ala., Oct. 13-14. Dr. Newdigate M. Owensby, 384 Peachtree St. N.E., Atlanta, Ga., Secretary.

Utah State Medical Association, Salt Lake City, Sept. 11-13. Dr. Ray T. Woolsey, 316 Atlas Bldg., Salt Lake City 1, Secretary.

Vermont State Medical Society, Burlington, Hotel Vermont, Oct. 1-3. Dr. Theodore H. Harwood, 128 Merchants Row, Rutland, Secretary.

Virginia, Medical Society of, Roanoke, Oct. 13-15. Miss Agnes V. Edwards, 1200 E. Clay St., Richmond 19, Secretary.

Washington State Medical Association, Seattle, Olympic Hotel, Sept. 28-Oct. 1. Dr. Harold E. Nichols, 327 Cobb Building, Seattle, Secretary.

Western New York and Ontario Urological Society, Saranac, N. Y., Saranac Inn, Sept. 3-6. Dr. Albert M. Crance, 525 S. Main St., Geneva, N. Y., Secretary.

Wisconsin, State Medical Society of, Milwaukee, Oct. 6-8. Mr. Charles H. Crownhart, 110 E. Main St., Madison 3, Secretary.

World Medical Association, Paris, France, Sept. 17-20. Dr. Charles Hill, B. M. A. House, Tavistock Sq., London, W. C. 1, England, and Dr. P. Cibrie, 60 boulevard de Latour-Maubourg, Paris 7e, France, Joint Secretaries.

Bureau of Information

LOCATION OF PHYSICIANS

Virginia Shuler
Chicago

This is the eighth of a series of charts showing the trend in locations of physicians from April 1946 to January 1947.

"Virginia has a very active Council on Health and Medical Care, which is supporting a program to be presented to the next session of the legislature, which will convene on Jan. 1, 1948. Some of the salient features of this program are the provision of state funds to match federal funds for the construction of medical facilities under the Hill-Burton Act—these funds to be applied where local areas cannot raise the matching amount; an increase in the amount of money ($800,000 on a matching basis) which was appropriated by the last legislature for the care of the indigent; demonstration and school health and education programs, which are already under way in five counties selected to represent average conditions in various sections of the state; study of prepayment plans as they apply to rural people; more beds for the care of open cases of tuberculosis, particularly of the infirmary type; provision and care for the mentally disabled. Recently the governor released a considerable sum of money for capital outlay and more adequate personnel for mental institutions. The question of making medical facilities available for doctors in rural sections is receiving intense study by several committees in the state. Of the utmost importance is the question of personnel. Efforts are being made to increase the salaries of the various personnel concerned in providing better health for the citizens of the state of Virginia. In order to do this it is realized that the state must increase its taxes so that they may take care of recurring obligations both in health and in education. This is a subject for discussion and debate at the present time, ultimately to be presented to the legislature. The council will formulate an overall program for health and medical care to extend over a period of years.

"The Committee on Rural Medical Service held a round table discussion at an institute on Rural Health at Virginia Polytechnic Institute in Blacksburg, Va., July 30. Approximately six hundred representatives of various farm organizations were present at this rural institute.

"It should be noted that the statistics regarding the distribution of doctors in Virginia may not be too accurate, but they definitely indicate a trend. Mr. Henry Johnson, director of public relations of the Medical Society of Virginia, is now conducting a survey with reference to the distribution at this time, and these figures will be available within the next few months."

H. B. MULHOLLAND, M.D., Chairman,
Virginia Council on Health and Medical Care,
University of Virginia Hospital, Charlottesville, Va.

VIRGINIA—1946

VIRGINIA—1947

Population, based on 1943 estimated Census figures, per active physician (excludes teaching, research, hospital administration, public health and state hospitals) by county.

Key: Physician-population ratio by county: plain area 1-999, dotted area 1,000-1,499, striped area 1,500-2,999, checked area 3,000 and over, solid black area no doctor.

TENNESSEE

"Recent studies of distribution of physicians in Tennessee show that in metropolitan counties we have one physician for a little over one thousand population, while in other areas there are over nine thousand patients per physician. This disproportion is increased by the fact that the young doctors are in the metropolitan area, while many doctors are over 65 in the rural districts. These figures may justify the opinion of some that there is no shortage in the metropolitan districts and that steps should be taken to increase the number of doctors in the portions of the state where there is not only a lack of doctors but a deficiency in hospitals, educational, religious and cultural institutions."

W. M. Hardy, M.D., Secretary-Editor,
Tennessee State Medical Association,
510 Doctors Building, Nashville 3.

NORTH CAROLINA

"We are well aware of the fact that North Carolina is now the eleventh most prosperous state in the union but is forty-second in the number of hospital beds per 1,000 population and forty-fifth in the number of doctors per 1,000 population.

"North Carolina has inaugurated a Hospital and Medical Care Program for the entire state with this noble objective as the goal—'The ultimate purpose of this program shall be that no person in North Carolina shall lack adequate hospital care or medical treatment by reason of poverty or low income.'

"The cities and small towns are adequately cared for; however, the rural areas in some sections of North Carolina are urgently in need of more physicians. At present rural North Carolina has only one doctor for each 3,613 people, and there is only one colored doctor for 6,916 colored people.

"With the state supported four-year medical school at the University of North Carolina with a 400-bed teaching hospital and a loan fund for medical students, and with medical training for negro youth, as well as grants made for the construction of new hospitals in areas not adequately served by existing hospital facilities, and the medical profession urgently insisting on voluntary insurance, we are confident that the statewide program in health and medical care will bring the state up to an average of four beds for every 1,000 population and one doctor for each 1,000 population. To this end, as quoted above, no person in North Carolina shall lack adequate hospital care or medical treatment by reason of poverty or low income."

Roscoe D. McMillan, M.D., Secretary,
Medical Society of the State of North Carolina,
P. O. Box 232, Red Springs, N. C.

WEST VIRGINIA

"The distribution of doctors in West Virginia on a population basis remains about the same, except for the more populous areas. The migration is still definitely toward the urban centers. With the return of nearly all of our doctors from military service, the situation in our industrial areas is somewhat relieved, although there is still a doctor shortage in the southern coal fields. There is still an acute shortage of medical care in our rural areas, although a few returning veterans have slightly improved the overall situation.

"It is thought that there will be a great improvement in medical care facilities when our hospital construction program gets under way. A survey is now being made for this purpose.

"A new division of mental hygiene has been activated in our state health department, from which much is expected in the future. Increased appropriations this year should improve conditions in our mental and tuberculosis institutions. We have two new active committees in the state medical association—the Committee on the Study of Diabetes and the Committee on Mental Hygiene."

GOVERNMENT SERVICES

ARMY

DOCTORS TO GET EXTRA $100 A MONTH

The Surgeon General announces that effective September 1 an additional $100 a month will be paid to all Regular Army Medical and Dental Corps officers as well as other officers serving voluntarily on extended active duty in these corps. This addition to the income of these officers is regarded by the War Department "as an equalization measure designed to bring the incomes of Medical and Dental Corps officers more nearly in line with those of civilian doctors and dentists." Surgeon General Bliss explained that the additional compensation will aid in reimbursing these officers for the costs of their professional education and for their loss of earnings while in medical or dental school.

The Army will also follow a new policy of commissioning selected doctors and dentists in the Regular Army in grades as high as colonel, depending on their age and professional qualifications. The measure authorizing such appointment also provides for such officers to be credited, for purposes of promotion, with the minimum number of years of service "now or hereafter required for promotion of officers of the Medical and Dental Corps to the grade in which appointed."

These important changes in the Army's medical program were made possible by legislation signed by President Truman August 5. This measure is in the form of an amendment to the Pay Readjustment Act of 1942.

General Bliss said the $100 increase in compensation will benefit not only Regular Army medical and dental officers but also Reserve, National Guard and Army of the United States Officers. Former students of the Army Specialized Training Program who are required to serve on extended active duty are eligible for this increase in compensation when they apply for and are accepted into the Regular Army. The enabling legislation limits the duration of these benefits to thirty years of active service. The extra $100 monthly compensation will be paid not only to officers who are on extended active duty as of September 1, the effective date of the legislation, but to all eligible Medical and Dental Corps officers who are commissioned in the Regular Army or who volunteer for extended active duty within the next five years.

MEDICAL SERVICE CORPS CREATED

A change in the permanent organization of the Medical Department of the Army went into effect August 5 following the President's approval of legislation creating a Medical Service Corps in the regular establishment. This legislation makes it possible for the first time to give Regular Army commissions to specialists in fields closely allied to medicine—to bacteriologists, entomologists, psychologists, sanitary engineers, pharmacists, chemists, electronics experts and the like. These will be grouped together in a new corps under the Medical Department of the Army. Previously the Medical Department was made up of six corps—Medical, Dental, Veterinary, Pharmacy, Nurse and Women's Medical Specialists. It has been possible to commission specialists in other fields only in the reserve, from which they could be called to service in a national emergency.

It became evident during the two world wars, with the new ramifications of medical science, that greater reliance must be placed on these other specialists. They could relieve the Army Medical Corps, in which only physicians can hold commissions, of a great deal of clinical laboratory and sanitary engineering activities, psychiatric social work and clinical psychology, pharmacy, supply and hospital administration, certain phases of training and field medical service, and in certain fields of research requiring specialized skills and training.

During World War I, half the commissioned personnel of the Medical Department were physicians. In the last war this percentage had fallen to about one third, with the difference taken up largely by specialists in fields allied to medicine. This is bound to constitute more and more the situation in the future as the ramifications of medicine extend into other sciences and new problems arise. It is impossible to predict what kind of a specialist will be needed tomorrow.

Under the present legislation the Surgeon General may use his discretion, as the need arises. An expert in enzyme chemistry, for example, can be given a regular commission in the new Medical Service Corps with no more complications than would be involved in commissioning a brain surgeon in the Medical Corps. The strength of the new corps will be prescribed by the Secretary of War. Grades will range from second lieutenant to colonel.

THE ARMY'S HYDROPONIC GARDENS

The Army is producing fresh vegetables for use with the ration in overseas installations in large quantities by the hydroponic method of gardening. Hydroponic gardens are being operated in places where transportation does not permit shipping fresh vegetables and where there is an inadequate rainfall, a lack of suitable soil or other difficulties which preclude growing vegetables in the ground. Hydroponic gardens are being operated on Iwo Jima, Atkinson Field in British Guiana, at Nanking, China, and in Japan. The garden at Chofu near Tokyo comprises 55 acres and the one at Otsu 25 acres. These are probably the largest and most productive gardens of their kind in the world. The hydroponic gardening method consists in using beds of gravel, stones or cinders or other inert materials for growing vegetables, supplying them with water and the necessary nutrient chemicals for their growth. The cost of producing vegetables by this method is low in comparison with the cost of transporting vegetables by refrigerator transportation over very long distances. The gardens now in use are expected to produce during the present growing season 2,000,000 pounds of tomatoes, 440,000 pounds of cucumbers, 310,000 pounds of lettuce, 200,000 pounds of radishes, 170,000 pounds of onions and 60,000 pounds of pepper, or sufficient to provide eight salad meals a week for 100,000 military personnel and their dependents.

Here is a representative list of chemicals of fertilizer grade comprising the nutrient solution in hydroponic gardening:

Potassium nitrate	19.8%
Potassium sulfate	17.9%
Calcium sulfate	27.3%
Magnesium sulfate	18.7%
Monocalcium phosphate	11.2%
Ammonium sulfate	5.1%
	100.0%

Also required in minute quantities are ferrous sulfate, ferric ammonium citrate, manganese sulfate, manganese chloride, boric acid, borax sodium tetraborate, copper sulfate and zinc sulfate.

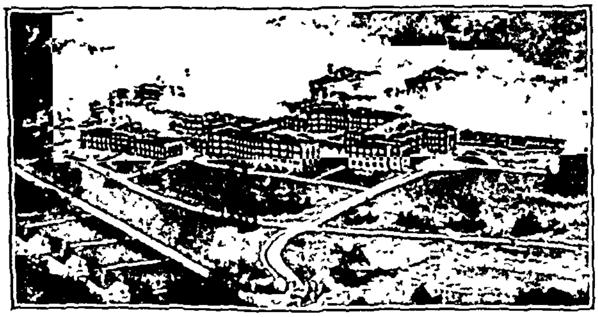
A ten bed garden unit, occupying about half an acre of land, is capable of producing enough to serve four hundred men a salad a day.

The origin of hydroponics dates back to 1699, when crude experiments were conducted. In 1925 a number of universities took up research on its possible commercial application, but the lack of specially trained operators hampered its expansion. In 1944 Gen. H. H. Arnold of the Army Air Forces observed the hydroponic activities at the Convalescent Hospital, Coral Gables, Fla., in connection with the rehabilitation program, and he secured skilled and competent authorities to develop a program for supplying the air forces with fresh fruits and vegetables from hydroponic gardens. The Air Forces withdrew from this activity in 1946 and the Quartermaster Corps was authorized to take it up and establish new gardens where certain conditions existed. A school of instruction in this work was opened in Japan in 1946 and was attended by 3 Ph.D.'s and 61 men with degrees in agriculture. This method may develop on a large scale in Japan, where less than 17 per cent of the land is sufficiently fertile to grow vegetables. The arable soil too is contaminated because of the long custom of using night soil as fertilizer. Soil-grown vegetables are not served to U. S. troops there without being cooked, on account of the danger of contracting amebic dysentery.

VETERANS ADMINISTRATION

TUBERCULOSIS HOSPITAL AT OTEEN

The 1,000 bed hospital at Oteen, N. C, built as an army general hospital during World War I was subsequently transferred to the U. S. Public Health Service and later to the Veterans Administration, which is using this facility as a tuberculosis hospital. The original army buildings have been replaced by permanent structures. It is 6 miles from Asheville in the Smoky Mountains National Park and on the eastern approach is the reservation of the Eastern band of Cherokee Indians, 3,000 of whom still follow their tribal customs and crafts.



Tuberculosis Hospital at Oteen, N. C.

Five resident physicians are training in thoracic surgery at the Veterans Administration Hospital, Oteen, N. C., where such a training program has been in effect since February. Nearly twenty other young doctors are training in other fields, while a class of cadet nurses has just completed a six months course in general nursing.

The resident physicians in training are young doctors who have completed the Army Student Training Program and the Navy V-12 courses and are now on loan from the Army and Navy to the Veterans Administration. Besides thoracic surgery, training is being given also in the diagnosis, care, treatment and rehabilitation of tuberculous veterans.

The Veterans Administration is in need of nurses for tuberculosis hospitals, and a training center has been established at the Oteen hospital for graduate and senior cadet nurses who desire to specialize in this kind of work. The salaries range from $2,644 to $6,000. Applications should be submitted to the Veterans Administration branch office having jurisdiction over the territory where nurses desire to work.

ADDITIONS TO THE STAFF

The chief medical director has announced the addition to the staff of the Veterans Administration department of medicine and surgery in Washington, D. C., of Dr. George M. Lyon, Huntington, W. Va., Dr. Louis G. Welt, Willimantic, Conn., and Dr. Earl A. Martin, a native of Ohio.

Dr. Lyon, who will develop laboratories for the use of radioactive isotopes in treatment of veteran patients, from 1936 to 1942 was a member of the joint committee on health problems on education of the American Medical Association and the National Education Association. He served during World War II as chemical warfare officer for the naval forces in Europe and later was safety adviser for the staff of the commander of the joint Army-Navy Task Force No. I. Dr. Welt will engage in research projects for the Research and Education Service of the Veterans Administration department of medicine and surgery. He is certified by the American Board of Internal Medicine and during World War II served with the 39th General Hospital in malaria control work and later in the office of the chief surgeon, general headquarters, AFPAC, and was editor of the *Journal of Military Medicine in the Pacific.* Dr. Martin has been appointed associate member of the Board of Veterans Appeals. He was commissioned in the Army Medical Corps in 1944 and assigned to the Veterans Administration, where he has been on duty since 1941. Formerly he was chief of the diagnostic center at the Veterans Administration Facility at Hines, near Chicago.

Dr. Gert Heilbrunn, former assistant clinical professor of psychiatry, University of Illinois College of Medicine, Chicago, has been appointed chief of the neuropsychiatric section of the Northwest Branch of the Veterans Administration, with headquarters in Seattle, where he also plans, it is reported, to enter private practice. Dr. Heilbrunn is a graduate of the University of Berne, Switzerland.

MISCELLANEOUS

SALE OF SURPLUS GOVERNMENT PROPERTY

The War Assets Administration Regional Office, 728 15th Street, Denver 2, is conducting a sale of pharmaceuticals, chemicals and drugs. Physicians who are veterans have certain priorities in the purchase of this government property. The sale closes August 25.

EXAMINATIONS FOR POSITION AS OCCUPATIONAL THERAPIST

The U. S. Civil Service Commission announces an examination for probational appointment to the position of occupational-therapist with salaries ranging from $2,644 to $5,905 a year for service in Veterans Administration hospitals and regional and branch offices throughout the United States. One position is open in the central office of the Veterans Administration in Washington, D. C. Applicants must be graduates of schools of occupational therapy approved by the American Medical Association or, in case of graduation prior to 1938, by the American Occupational Therapy Association, and must have certain other qualifications. Applications must be filed in the various Veterans Administration branch offices throughout the country not later than August 12.

PLACEMENT OF BLIND CIVILIANS

The Office of Vocational Rehabilitation conducted a training institute in Washington late in June to stimulate commercial placement of blind civilians. In attendance were employment specialists from eighteen state vocational rehabilitation agencies who received instruction in public relations, design and layout of equipment, merchandising, advertising and other subjects related to the program of helping the blind undertake business enterprises. On completion of the short course in training, the state representatives returned to their home states to give further help in preparing eligible blind persons to engage in small business enterprises successfully.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

CALIFORNIA

Health Officer Retires to Take Up Private Practice.—Dr. Peter J. Cuneo retired as health officer of the city of Bakersfield after nearly thirty-two years of service to devote his time to private practice, when the public activities in Bakersfield were placed under the Kern County Health Department, April 3.

Plague Infection.—First reports of plague from specimens of rodents or their ectoparasites for this year were reported by the Bureau of Vector Control in June. In Monterey County plague was found in fleas from captured rodents in two locations south of the city of Monterey, and in Lassen County plague was traced to fleas and lice from rodents captured in Nubieber and to fleas from rodents south of Adin.

Course in Psychiatry and Neurology.—The Langley Porter Clinic, the Medical Center, San Francisco, will offer a twelve weeks course in psychiatry and neurology beginning September 8. Courses will be given by the Division of Psychiatry, University of California Medical School, Berkeley-San Francisco, in cooperation with the University Extension Division. Hours will be from Monday to Friday, 9 a. m. to 5 p. m., with work on Saturdays, 8 to 10 a. m. Registration is limited to 60 persons.

Committee to Make Cancer Survey.—The Cancer Committee of the San Francisco County Medical Society is undertaking a survey of the cancer control program. The general purposes are (1) to gather and present significant and statistical epidemiologic data and suggest ways in which more information can be secured, (2) to determine educational activities being conducted and how they can be expanded, (3) to obtain information on present diagnostic and treatment services and (4) to coordinate the resources for cancer control. The survey will be under the direction of Dr. Lester Breslow of the California Department of Public Health.

CONNECTICUT

Personal.—Dr. Louis G. Welt, clinical instructor of medicine at Yale University School of Medicine, New Haven, has been appointed to a medical research post with the Veterans Administration, Washington, D. C. Dr. Walt received his medical degree at Yale University School of Medicine, 1938, and has practiced medicine in Connecticut since 1939.

Annual Clinical Congress.—Dr. Francis G. Blake, dean of the Yale University School of Medicine, New Haven, and chairman of the Committee on the Clinical Congress of the Connecticut State Medical Society, has announced that the 1947 congress will be held in New Haven on September 16-18. Members of the committee, all of New Haven, include Drs. Gerbert E. Thoms, Arthur J. Geiger, Courtney C. Bishop, Harry B. Shumacker Jr., Hugh M. Wilson, Frederick C. Redlich, William R. Wilson and Daniel C. Darrow.

ILLINOIS

Narcotic Violation.—The Treasury Department, Bureau of Narcotics, advises that Dr. Arthur W. LoVene, Oquawka, pleaded guilty at Springfield to violation of the Federal Narcotic Act, and on July 25 was sentenced to a term of thirty days.

Improved Water Supplies.—The state sanitary water board has approved plans for the installation of new or improved water systems in nine Illinois communities, at Cambria, Nauvoo, Normal, East St. Louis, Neponset, Creal Springs, Wayne City, Tolono and Riverside.

Open Cancer Diagnostic Clinic.—A new state aided cancer diagnostic clinic was opened this month at Graham Hospital, Canton, under the direction of Drs. David A. Bennett, Roy L. Patterson, Marcos A. Quinones and Roderick H. Maguire, all of Clinton. Clinic sessions, beginning at 10 a. m., are scheduled for the first Thursday following the first Monday of each month.

New Building for Keeley Institute.—A new $500,000 hospital building for the treatment of alcoholic addicts will be built on a 20 acre site at Dwight, Ill., for the 68 year old Keeley Institute. The building will accommodate 75 more patients, which will include women, up to this time excluded. It will have 84 rooms, dining facilities for 130, treatment rooms and administrative offices.

Competitive Examination for Health Officers.—The Illinois Department of Public Health announces a competitive examination for health officers which will be held in Chicago on October 27. This examination is being held for the purpose of obtaining a list of eligible persons from which the Board of Health of the Champaign-Urbana Health District, Champaign, and the Stickney Health District, Cook County, may select health officers. These positions will carry salaries of about $7,000 a year. Admission to the examination will be limited to persons having training and/or experience in the public health field. For information write to Roland R. Cross, M.D., Director, Illinois Department of Public Health, Springfield.

Chicago

Open the Exhibit on Growth.—"The Miracle of Growth," an exhibit of growth and development of the individual from conception through adolescence, was unveiled at the Museum of Science and Industry in Jackson Park, August 6. The exhibit, produced by the department of medical and dental illustration of the Chicago Professional Colleges of the University of Illinois, was presented to the museum by Dr. George D. Stoddard, president of the university. The display represents an extensive experiment in visual education. Physical, mental and psychologic growth of the normal individual are portrayed. A transparent pregnant woman is the central figure of the display. The story of growth is revealed in the thirteen wall cases showing the growth of the child through adolescence. The principles of heredity are discussed in a series of electrically controlled questionnaires. The official opening of the exhibit climaxes more than two and a half years of planning, development and construction by Professor Thomas S. Jones and his staff.

Dr. Kendell to Head Department of Physical Medicine.—Dr. Herbert W. Kendell, Chicago, former medical director of the Chicago Intensive Treatment Center, has been named head of the department of physical medicine at the University of Illinois. The department, established last year, represents a combination of the departments of physical therapy and occupational therapy. Dr. Kendell has just completed a Baruch fellowship for graduate study in physical medicine at the Mayo Clinic, Rochester, Minn., and at the Massachusetts Institute of Technology, Boston. After graduating at the University of Cincinnati Medical School in 1933 he joined the staff of Miami Valley Hospital, Dayton, where six years later he became head of the department of physical medicine. Later he became medical director of the Chicago Intensive Treatment Center, U. S. Public Health Service. In 1944-1945 he was an associate professor in the department of physical medicine at Northwestern University and also served as medical director of the State Fever Therapy unit and Brookhaven Medical Center at Brookhaven, Miss. He is president-elect of the American Congress of Physical Medicine.

MARYLAND

Dr. Sadusk Appointed Associate Medical Director.—Dr. Joseph F. Sadusk Jr., Baltimore, has been appointed to the home office staff of the Prudential Insurance Company of America as associate medical director. A graduate of Johns Hopkins University School of Medicine, Baltimore, 1935, he was an instructor in medicine at Yale University from 1939 to 1942 and returned to Yale in 1946 as assistant professor of medicine. He served in the U. S. medical corps, 1942-1946, and was discharged with the rank of colonel. During his war service he was the executive officer of the United States of America Typhus Commission, which awarded him the Typhus Commission Medal.

MASSACHUSETTS

Dr. C. Guy Lane Becomes Professor Emeritus.—Dr. C. Guy Lane, Boston, chief of the dermatologic service, Massachusetts General Hospital, Boston, since 1936 retired June 1 and will devote his entire time to private practice. A graduate of Harvard Medical School, Boston, 1908, Dr. Lane joined the dermatology department in September 1919, following postgraduate training in New York and service in World War I. In 1928 he was appointed dermatologist to the hospital. In 1943 he continued his work beyond the hospital retirement age because of war emergency. He was instrumental in the formation of the American Board of Dermatology and Syphilology and served many years as its secretary. Dr. Lane has been appointed emeritus professor of dermatology at Harvard Medical School, where he has been teaching since 1925.

MICHIGAN

Community Honors Veteran Doctor.—About 400 physicians in central Michigan, patients and friends of Dr. Bert C. Hall, Pompeii, attended a dinner in celebration of his half century as a county physician July 6. A scroll from the Gratiot-Isabella-Clare counties medical association was presented to Dr. Hall, along with other gifts.

Impostor Put on Probation.—Recorder's Judge George Murphy, Detroit, July 14, placed Theodore H. Cole, 23, of 89 Canfield Avenue East, Detroit, on a year's probation for practicing medicine without a license. Cole, a student at Cass Technical High School, admitted prescribing for a score of patients and participating in an appendectomy. During the war he said he had served in the Army Medical Corps.

New Director of Kimball Sanatorium.—Dr. Arthur S. Kimball, Pontiac, on August 1 took over the directorship of the Arthur S. Kimball Sanatorium, Battle Creek, Calhoun County tuberculosis hospital named in honor of his father. He succeeds Dr. W. Leonard Howard, Battle Creek, who resigned to become head of Maybury Sanatorium at Northville. A graduate of McGill University Faculty of Medicine, Montreal, in 1939, he has been medical director of the Oakland County Tuberculosis Sanatorium at Pontiac.

Rural Health Conference.—The Michigan Rural Health Conference will be held at Snyder Hall and the Fairchild Theater, Michigan State College, East Lansing, September 18-19, sponsored by the Michigan State and Ingham County medical societies and twenty-five other state health, rural and educational organizations. Section meetings will be held for discussions of (1) Hospital Facilities and Health Centers, (2) Bringing and Holding Physicians in Rural Areas, (3) Financing Personal Health and (4) Nursing and Ancillary Needs of Rural Communities.

Personals.—Dr. M. William Clift, Flint, chief of radiology at Hurley Hospital since 1932, became radiologist at Midland Hospital July 1. He has served as radiologist in Receiving, Wyndotte and Shirley hospitals, Detroit, and was an associate professor at Detroit Medical College.——Dr. Frederick H. Shillito, formerly of Kalamazoo, Mich., and now medical director for Pan American Airways' transatlantic division, made the inaugural flight of Pan American's commercial round the world service last month.

MINNESOTA

Dr. Helmholz Honored.—*At the recent International* Congress of Pediatrics in New York, several Latin American countries honored Dr. Henry F. Helmholz, professor of pediatrics, Mayo Foundation, University of Minnesota. Dr. Helmholz was awarded certificates of honorary membership in the Latin American Division of the American Academy of Pediatrics and in the Sociedade Brasileira de Pediatrics. He also was decorated in the National Order of Merit of Carlos J. Finlay in the grade of Commander from the Cuban government in recognition of his services in furthering pediatric practice in Latin American countries.

NEVADA

State Medical Meeting at Reno.—The Nevada State Medical Association will hold its annual meeting September 5-6 at the State Building, Reno, under the presidency of Dr. John A. Fuller, Reno. Out of state speakers will be:

Dr. Jack M. Farris, Los Angeles, Vagus Resection and Peptic Ulcer.
Dr. Edwin A. Lawrence, Salt Lake City, Surgery of the Diseases of the Chest.
Dr. Verne T. Inman, San Francisco, Anatomicophysiologic Problems Associated with Poliomyelitis.
Dr. Herbert H. Darling, San Francisco, Discussion of Veterans' Problems.
Dr. Earl R. Miller, San Francisco, Isotopes and the Effect of Radioactive Iodine on Thyroid.
Dr. Samuel H. Hurwitz, San Francisco, Allergy in General Practice.
Dr. David O. Harrington, San Francisco, Radiation Therapy in Ophthalmology.

NEW JERSEY

Dr. O'Crowley Receives Award.—At the June meeting of the Academy of Medicine in northern New Jersey, Dr. Clarence R. O'Crowley, Newark, N. J., received the Edward J. Ill award. On the plaque presented to him he was designated as "scholarly urologist, resourceful executive, forceful citizen." Dr. O'Crowley is a graduate of the Columbia University College of Physicians and Surgeons, New York, 1904. He is on the staff of various hospitals as a consultant urologist and is a past president of the American Urological Association, the New York Urological Society and the American Association of Genito-Urinary Surgeons and professor of urology in the Graduate School of the University of Pennsylvania. He is now on the editorial board of the *American Journal of Surgery.*

NEW YORK

New Wings and Other Buildings.—Nassau County's Meadowbrook Hospital, Hempstead, will construct two new wings and other new buildings and expand existing facilities in a building program to cost $6,200,000. The program will give the institution 615 beds, more than double its present capacity, and will furnish quarters for 300 nurses, a 65 car garage, enlarged kitchen and operating facilities, and a medical examiner's laboratory and office.

Personal.—Dr. Nelson W. Strohm, Buffalo, has been appointed full time director of Tuberculosis Control in the Buffalo Department of Health. He has been associated with the chest clinic of the Division of Communicable Diseases of the Buffalo Health Department since 1919, and since February 1 of this year has been chief of the diagnostic clinic of the health department. He is a graduate of the University of Buffalo School of Medicine and an associate in medicine on the faculty.

Illegal Practitioners Convicted.—The Medical Society of the County of Erie reported in its July Bulletin that a New York County jury on June 26 convicted two persons who represented themselves as chiropractors, under the sections of the state education law which prohibit the practice of medicine by any one who does not possess a registered license in medicine. The defendants, Michael and Kathryn Scallon, had treated or attempted to treat a 16 year old girl, who later died of tuberculosis, by means of chiropractic adjustments.

New York City

Course in Manipulative Surgery.—Columbia University College of Physicians and Surgeons will offer from 9 a. m. to 5 p. m., September 8-11, a concentrated course in manipulative surgery at the Columbia Presbyterian Medical Center by Dr. James B. Mennell, St. Thomas Hospital of London and Oxford University.

City Tuberculosis and Health Association.—Dr. Herbert R. Edwards, director of the Bureau of Tuberculosis, New York City Department of Health, has been appointed executive director of the New York City Tuberculosis and Health Association. He will succeed Frank Kiernan September 1. Dr. Edwards is a past secretary of the National Tuberculosis Association. He has served in the departments of health of Virginia, Connecticut and New York City, with which he has been associated since 1934.

The Salmon Lecture.—Harold D. Lasswell, Ph.D., Washington, D. C., has been elected to deliver the Salmon lectures for 1947, sponsored by the Salmon Committee on Psychiatry and Mental Hygiene of the New York Academy of Medicine. His lectures on "The Dynamics of Power and Personality" will be delivered on Wednesday, Thursday and Friday evenings, November 12-14, at the Academy of Medicine. Dr. Lasswell, professor of law, Yale University, is a consultant of the department of state, and since 1939 he has been director of the war communications research. Each year the Salmon Committee selects a lecturer who it deems has made the greatest contribution to his particular field during the preceding year. The chairman of the committee is Dr. C. Charles Burlingame, psychiatrist, Hartford, Conn.

Teaching Affiliation with St. Luke's Hospital.—Columbia University and St. Luke's Hospital announced July 19 an affiliation effective immediately for the teaching of medical students and the training of hospital residents and graduate physicians. Twenty-four students of Columbia University College of Physicians and Surgeons will serve their clinical clerkships in the wards and laboratories of St. Luke's under the instruction of members of the hospital staff directed by Dr. John F. Keating, chief of staff of the hospital's medical board. The St. Luke's medical board will continue to appoint interns and residents, the latter to be considered graduate medical students for whom the hospital and university will provide advanced instruction and experience. St. Luke's will train the doctors in its wards, operating rooms and other hospital facilities, while Columbia will offer them opportunities in its scientific laboratories for specialized instruction, research and advanced training under its established program of graduate medical education. Members of the hospital staff who are directly responsible for instruction will be appointed to academic positions in the university. A joint committee of the medical board of the hospital and the Columbia faculty of medicine will be created to coordinate the cooperative educational program and to make recommendations to both institutions on any matters affecting the program. The agreement states that "nothing in this teaching affiliation shall be construed to interfere with the separate corporate organization or the administration of the professional services of St. Luke's Hospital." This affiliation now formalizes what has been always an agreeable and productive liaison.

NORTH CAROLINA

State Medical Election.—At the recent annual meeting of the Medical Society of North Carolina at Virginia Beach, Va., Dr. Frank A. Sharp, Gainsboro, became president, Dr. James F. Robertson, Wilmington, president-elect and R. Roscoe D. McMillan, Red Springs, secretary-treasurer.

University Appointments.—The department of medicine, Duke University School of Medicine, Durham, has recently added the following members to its staff: Dr. John Hickam, research fellow of American College of Physicians, Emory University School of Medicine, Atlanta, Ga.; Dr. Frank L. Engel, associate in medicine, Emory, 1945 to 1947, and Dr. Jack D. Myers, associate in medicine, Emory, 1946 to 1947.

OHIO

Professor Woodward Retires.—Dr. Henry L. Woodward, Cincinnati, has retired as professor of obstetrics and director of the department of obstetrics at the hospital of the University of Cincinnati College of Medicine. Dr. Woodward, who has held the rank of professor and hospital department director since 1925, developed the residency system of training in obstetrics at the hospital. He served for forty-five years without financial compensation from the University of Cincinnati. The university board authorized a resolution in tribute to Dr. Woodward for his long service.

To Grant Degree in Industrial Medicine.—Plans for a new instructional unit, an Institute of Industrial Health, at the University of Cincinnati, have been announced under which study will lead to the degree of Doctor of Industrial Medicine. The university's Kettering Laboratory of Applied Physiology, Dr. Robert A. Kehoe, director, is the central unit of the institute. Cooperating with the laboratory staff will be faculty members of the university's Colleges of Medicine, Law, Business Administration and Engineering. In addition, a group of physicians in industrial organizations will assist and make available their medical facilities. Applicants for admission will be screened to meet unusually high requirements for entrance and those accepted will be limited in number. The prerequisite for admission is graduation from an approved medical school plus at least two years of training in a hospital accredited by the American Medical Association for training resident physicians. A third year of practical experience in industry is advisable. Plans are under way with a number of industries to give further aid to the institute's program by financing fellowship grants for students. The Kettering Laboratory was founded by gifts from American industry to attack the hazards to life and health presented by new chemical and manufacturing processes.

OREGON

State Medical Meeting at Portland.—The Oregon State Medical Society will hold its annual session September 4-6 at the University of Oregon Medical School, Portland, under the presidency of Dr. Stanley Lamb, Portland. Among others, guest speakers include Dr. Clifford D. Sweet, Oakland, Calif., who will speak on the child as a patient; Dr. Hans Lisser, San Francisco, medicine; Dr. Henry N. Harkins, Seattle, vagotomy in the surgical treatment of peptic ulcer; Dr. Hyman Miller, Beverly Hills, Calif., diagnosis and treatment of clinical allergy. The annual banquet will be Friday at 7 p. m. at the Hotel Multnomah, where Dr. Raymond B. Allen, president, University of Washington, will speak on "Medicine and Our Changing Times."

PENNSYLVANIA

Night Calls.—The Lackawanna County Medical Society has begun a plan to make medical service available twenty-four hours a day. Persons unable to reach their regular physician during night hours can call the Medical Answering Service telephone number, and they will be given the name of a doctor available in their area. Police and telephone company officials have been notified so that medical service can be obtained in the shortest time. The service is maintained on a twenty-four hour basis.

Appointment to Psychiatric Committee.—Dr. J. Franklin Robisson, director, Children's Service Center of Wyoming Valley, Inc., Wilkes-Barre, has been named to the Committee on Child Psychiatry of the Group for the Advancement of Psychiatry. The formation of this group was recommended by the American Psychiatric Association as an unofficial advisory group, which in the next year or two will reconcile the standards and aims of the various organizations within the psychiatric field and propose a generally accepted program to the American Psychiatric Association. The Committee on Child Psychiatry will establish training and standards on practice and clarify the relationship between the procedures in child and adult psychiatry.

GENERAL

American Chemical Society Meeting.—The national meeting of the American Chemical Society will be held in New York, September 15-19, with general headquarters at the Hotel Pennsylvania, under the presidency of Dr. W. Albert Noyes Jr., chairman of the department of chemistry, University of Rochester, Rochester, N. Y. Eleven thousand chemists are expected to attend the eighteen professional divisions of the society.

Drs. Schwartz and Armstrong Win Essay Contest.—Drs. Steven O. Schwartz and Berthe E. Armstrong of the Hektoen Institute for Medical Research of the Cook County Hospital, Chicago, won the 1947 Mississippi Valley Medical Society essay contest. Their subject was "Treatment of Iron Deficiency (Hypochromic Anemia)." They will receive a cash award and will present their essay at the twelfth annual meeting of the Mississippi Valley Medical Society at Burlington, Iowa, October 1-3.

Anniversary of Sir Ronald Ross's Discovery.—The fiftieth anniversary of the discovery by Sir Ronald Ross of living and growing malaria parasites in the stomach wall of certain mosquitoes which had been allowed to feed on patients with malaria will be observed on August 25. With this discovery the enormously interesting and important scientific work on the prevention and better treatment of malaria was placed on a solid foundation. Sir Ronald Ross was a little known medical officer serving with the British army in the hinterlands of India when he made the discovery for which the Nobel Prize later was awarded to him.

Centennial Speeches by Clergymen Available on Records.—The speeches at the religious observance which opened the American Medical Association centennial have been recorded, and phonograph records can be made available if there is sufficient interest in the medical profession in having these records. The three sermons (see p. 1478) by Monsignor Fulton J. Sheen, Rabbi Joshua Loth Liebman and Rev. Ralph C. Hutchison, in condensed form as delivered by radio, will be made available in three phonograph records of two sides each on vinylite plastic. Delivered in a cloth-bound album, the price will be $6, remittance to accompany the order. Address the Order Department, American Medical Association, 535 North Dearborn Street, Chicago 10.

Medical Record Librarians Meeting.—The annual conference of the American Association of Medical Record Librarians will be held September 7-12 at the Hotel Commodore, New York. Subjects to be discussed include the Future of Medical Records in the Army, Navy and Veterans' Hospitals; Uses of Mechanical Aids in the Medical Record Department; Procedure in Reorganization of the Medical Record Department; Methods of Organizing State and Local Associations; Medical Audit, Compilation of Statistics, Civil Service Recognition and Establishment of Job Classifications in Federal, State and County Hospitals. Friday afternoon there will be a panel discussion on Standard Nomenclature of Disease and Operations.

Extend Closing Date of Hygeia Suggestion Contest.—At the centennial session in Atlantic City in June a contest was opened with the object of obtaining suggestions for the improvement of *Hygeia*, the health magazine published by the American Medical Association. Thirty-seven prizes varying from $100 to $5 are available to winners in the contest. Those desiring to participate only need write a brief letter of one hundred words or less suggesting how to improve the editorial content, pictorial presentation, typography or other features of *Hygeia*. The closing date for the contest has been extended to September 30. Letters should be mailed to the editor, Hygeia, 535 North Dearborn Street, Chicago 10, before midnight September 30. *Hygeia* reserves the right to quote all or part of these letters. The judges will be a committee of officials of the American Medical Association. The contest is open to physicians, interns and medical students.

Edwin Grey Cope ⊕ Hornersville, Mo.; St. Louis College of Physicians and Surgeons, 1910; past president of the Dunklin County and Southeast Missouri Medical societies; served on the school board; on the staff of the Presnell Hospital in Kennett, where he died May 28, aged 65, of heart disease.

Clarence Vincent Costello ⊕ Holland, Mich.; University of Buffalo School of Medicine, 1911; fellow of the American College of Surgeons; formerly instructor in surgery at the University of Rochester School of Medicine and Dentistry; an officer during World War I; served on the staffs of the Strong Memorial, Rochester General, St. Mary's, Monroe County and Rochester State hospitals, all in Rochester, N. Y.; on the staff of the Holland Hospital; died in Los Angeles May 31, aged 60, of carcinoma of the esophagus.

William Wilhelm Craven, Charlotte, N. C.; University of Maryland School of Medicine, Baltimore, 1903; member of the American Medical Association; died May 15, aged 68, of coronary thrombosis.

James Lester Davis, Unionville Center, Ohio; Starling Medical College, Columbus, 1906; member of the American Medical Association; died in St. Francis Hospital, Columbus, May 5, aged 77, of intestinal obstruction.

William Davis ⊕ St. Paul; Harvard Medical School, Boston, 1880; an Affiliate Fellow of the American Medical Association, serving as a member of the House of Delegates in 1903 and 1904; past president of the Ramsey County Medical Society and the Minnesota State Medical Association; at one time member of the state board of medical examiners; died May 9, aged 93, of fracture of the hip and malnutrition.

Alfred Desrochers, Adams, Mass.; Albany (N. Y.) Medical College, 1895; on the courtesy staff of the St. Luke's Hospital in Pittsfield; on the staffs of the North Adams (Mass.) and the Plunkett Memorial hospitals; died May 13, aged 80, of coronary thrombosis and pernicious anemia.

James Edwin Dewey, Springfield, Mo.; Rush Medical College, Chicago, 1903; interned at the Frisco Hospital in Springfield and St. Mary's Hospital in Kansas City; member of the American Medical Association; past president of the Greene County Medical Society; served during World War I; on the staffs of St. John's and Burge hospitals and the Springfield Baptist Hospital, where he died May 23, aged 67, of coronary thrombosis.

Clyde Owen Donaldson ⊕ Kansas City, Mo.; University Medical College of Kansas City, 1900; past president of the Jackson County Medical Society; member of the American College of Radiology; served in France during World War I; died in St. Joseph Hospital May 25, aged 69, of cerebral occlusion.

Harold Sparrow Dorrance, Rochester, N. Y.; Harvard Medical School, Boston, 1920; member of the American Medical Association and the Rochester Academy of Medicine; on the staff of the Highland Hospital; died May 21, aged 55, of coronary thrombosis.

Charles M. Eckler, Williamstown, Ky.; Kentucky School of Medicine, Louisville, 1908; member of the American Medical Association; member of the Selective Service Board during World War II; for many years medical examiner for the Southern Railway; served on the board of education of Williamstown and the county board of health; director of the Bank of Williamstown; past president of the Rotary Club; died June 7, aged 67, of heart disease.

Alton Le Roy Flanders, Boston; University of the City of New York Medical Department, 1893; died April 16, aged 83, of cerebral hemorrhage.

Edgar Arthur Forsyth, Buffalo; Niagara University Medical Department, Buffalo, 1889; member of the American Medical Association and the American Laryngological, Rhinological and Otological Society; fellow of the American College of Surgeons; specialist certified by the American Board of Otolaryngology; on the staffs of the Millard Fillmore, Emergency, Our Lady of Victory and Charity Eye, Ear, Nose and Throat hospitals; died May 25, aged 79, of uremia.

Alfred Edward Foster, Wilkes-Barre, Pa.; Baltimore Medical College, 1910; member of the American Medical Association; died in the General Hospital May 29, aged 69, of cerebral hemorrhage.

Walter Thompson Garfield ⊕ Boston; Harvard Medical School, Boston, 1909; professor of dermatology and syphilology emeritus at the Tufts College Medical School; specialist certified by the American Board of Dermatology and Syphilology; member of the New England Dermatological Society; consultant, Norwood (Mass.) and Long Island hospitals; on the staffs of the Evangeline Booth Maternity Hospital, Cambridge City (Mass.) Hospital and the Boston City Hospital, where he died May 31, aged 65, of cerebral thrombosis.

William Leak Gilbert, Atlanta, Ga.; Atlanta Medical College, 1888; Jefferson Medical College of Philadelphia, 1891; member of the American Medical Association; served as health officer of Fulton County and as a member and chairman of the board of county commissioners; died May 7, aged 81.

Harry Theodore Harding, Washington, D. C.; College of Physicians and Surgeons, medical department of Columbia College, New York, 1893; member of the American Medical Association; died in the Garfield Memorial Hospital May 28, aged 77, of diabetes mellitus.

John R. Heath ⊕ Grover Hill, Ohio; Starling Medical College, Columbus, 1887; served as president and secretary of the Paulding County Medical Society, president of the Tri-County Medical Society, comprising Paulding, Van Wert and Mercer counties, coroner of Pike County and health commissioner of Paulding County; died May 24, aged 88, of cerebral hemorrhage.

Olly J. Henslee, Cincinnati; Medical College of Ohio, Cincinnati, 1894; at one time affiliated with the Good Samaritan and General hospitals; died May 22, aged 80, of heart disease.

Alfred Webb Herron, Vinita, Okla.; Arkansas Industrial University Medical Department, Little Rock, 1891; member of the American Medical Association; on the staff of the Eastern Oklahoma Hospital; served as president of the Bank of Adair; died May 16, aged 76, of coronary thrombosis.

Frank Hussy Jackson ⊕ Houlton, Maine; Columbia University College of Physicians and Surgeons, New York, 1901; fellow of the American College of Surgeons; member of the New England Surgical Society; medical examiner for Aroostook County; served during World War I and World War II as an examining physician for the local draft boards; on the staff of the Aroostook Hospital; served as chairman of the editorial board of the *Maine Medical Journal;* died May 16, aged 70.

Jacob Kaszer, Plymouth, Ind.; College of Physicians and Surgeons of Chicago, 1886; served as county coroner; died May 28, aged 91, of senility.

Abraham Joseph King, Indianapolis; Indiana Medical College, School of Medicine of Purdue University, Indianapolis, 1907; died June 17, aged 84, of cerebral hemorrhage and chronic myocarditis.

Harry Hartung Kleinberger ⊕ Millburn, N. J.; University of Cincinnati College of Medicine, 1931; police surgeon for many years; on the staffs of the Orange (N. J.) Memorial Hospital and the East Orange (N. J.) General Hospital; died in the Sinai Hospital in Baltimore June 5, aged 43, of uremia.

Otto F. Krueger, Milwaukee; Wisconsin College of Physicians and Surgeons, Milwaukee, 1896; died June 4, aged 71, of carcinoma of the tongue.

George Ludwig Laporte ⊕ New York; Columbia University College of Physicians and Surgeons, New York, 1894; served as assistant professor of clinical medicine at his alma mater; on the consulting staff of the Lenox Hill Hospital; died June 16, aged 73, of arteriosclerosis and chronic myocarditis.

Everton Jay Lawrence, Windermere, Fla.; Western Reserve University Medical Department, Cleveland, 1905; died in the University Hospital, Cleveland, June 19, aged 70, of hypertension and heart disease.

Robert Rickards Leach, Oil City, Pa.; University of Rochester School of Medicine and Dentistry, 1945; died June 3, aged 30.

Albert Washington Lewis, Copperhill, Tenn.; University of Nashville Medical Department, 1901; member of the American Medical Association; died May 16, aged 72, of Parkinson's disease and acute nephritis.

William J. Loler, St. Louis; Barnes Medical College, St. Louis, 1899; died in Indio, Calif., April 28, aged 71, of cerebral hemorrhage.

Edward G. Lukemeyer, Huntingburg, Ind.; Louisville (Ky.) Medical College, 1885; past president of the Du Bois County Medical Society; director of the First National Bank; surgeon for the Southern Railway; died May 26, aged 87, of angina pectoris.

Harold Cleveland Lyman, Utica, N. Y.; New York Homeopathic Medical College and Flower Hospital in New York, 1917; affiliated with the Memorial Hospital; died May 20, aged 54, of acute myocarditis and calculous pyonephrosis.

Patrick George McCabe ⊕ Fond du Lac, Wis.; Milwaukee Medical College, 1912; served during World War I; past president of the Fond du Lac County Medical Society; on the staff of St. Agnes Hospital, where he died May 17, aged 63, of general peritonitis secondary to pneumonia.

Donald Ellison MacGregor ⊕ Indianapolis; Chicago College of Medicine and Surgery, 1917; served during World War I and later with the Army of Occupation in Germany; on the staff of the Methodist Hospital, where he died June 20, aged 55, of carcinoma of the esophagus with metastasis to the liver and lungs.

Donald Ross MacIntyre, Negaunee, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1905; fellow of the American College of Surgeons; member of the medical staff of the Cleveland-Cliffs Iron Company; died in the Morgan Heights Sanatorium in Marquette June 5, aged 65, of tuberculosis.

Sherman Logan McKinney, Huntingburg, Ind.; University of Louisville Medical Department, 1912; member of the American Medical Association; also a graduate in pharmacy; served overseas during World War I; affiliated with St. Mary's Hospital in Evansville; a director of the First National Bank, where he had been president; died in the Norton's Infirmary, Louisville, May 29, aged 59, of cardiac failure.

Julian Yerkes Malone ⊕ Milwaukee; Washington University School of Medicine, St. Louis, 1921; served with the Chemical Warfare Service during World War I; on the staffs of the Columbia Hospital, Children's Hospital and Mount Sinai Hospital, where he died June 10, aged 54, of hypertension.

Sheridan Waterman Mattox ⊕ Marion, Ohio; Eclectic Medical Institute, Cincinnati, 1896; past president of the Marion Academy of Medicine; served during World War I; served on the board of health; died May 24, aged 78, of cerebral hemorrhage.

Matthew Taylor Mayes, Springfield, Mass.; Dartmouth Medical School, Hanover, N. H., 1903; for many years a member of the state board of registration in medicine; died June 2, aged 76, of coronary thrombosis.

Charles Joseph Mengis, Buffalo; Niagara University Medical Department, Buffalo, 1897; died April 27, aged 72, of hypertension and cerebral hemorrhage.

Washington Merscher ⊕ Clifton Springs, N. Y.; University of Pennsylvania School of Medicine, Philadelphia, 1910; formerly instructor in medicine and volunteer assistant in the cardiac clinic at the Temple University School of Medicine in Philadelphia, where he was on the staff of the Germantown Hospital and from 1932 to 1937 lecturer on medical diseases at the Germantown Hospital Nurses Training School; affiliated with the Clifton Springs Sanitarium; died June 15, aged 58, of coronary thrombosis.

Charles Albert Miller, Las Cruces, N. M.; College of Physicians and Surgeons, Baltimore, 1897; member of the American Medical Association; served as president and councilor of the Fourth District of the New Mexico Medical Society; past president, Dona Ana County Medical Society; for many years physician for the Selective Service; member of the school board; jail physician; died May 13, aged 76, of chronic myelogenous leukemia.

Thomas Moate, Gridley, Ill.; Northwestern University Medical School, Chicago, 1897; member of the American Medical Association; died May 31, aged 75, of coronary thrombosis.

George Washington Morgan, Yerkes, Ky.; University of Louisville Medical Department, 1911; died May 17, aged 66.

Herman Alfred Morrill, Gardner, Mass.; University of Vermont College of Medicine, Burlington, 1925; member of the American Medical Association; served overseas during World War I; affiliated with the Hospital Cottages for Children at Baldwinsville and the Henry Heywood Hospital, where he died May 28, aged 48, of rheumatic heart disease.

John Reid Morrison ⊕ Bellingham, Wash.; Trinity Medical College, Toronto, Ont., Canada, 1902; member of the medical advisory board of Whatcom County during World War I; fellow of the American College of Surgeons; served as president and vice president of the Washington State Medical Association; on the staffs of St. Luke's Hospital and St. Joseph's Hospital, where he died April 8, aged 73, of chronic myocarditis and diabetes mellitus.

Albert Carl Muccilli, Duluth, Minn.; Marquette University School of Medicine, Milwaukee, 1944; interned at the Naval Hospital, National Naval Medical Center in Bethesda, Md.; served in the medical corps of the U. S. Naval Reserve during World War II; accidentally drowned at Boulder Lake while fishing May 15, aged 26.

Francis Albert Muccilli, Duluth, Minn.; Marquette University School of Medicine, Milwaukee, 1944; interned at St. Mary's Hospital in Detroit; served in the medical corps, Army of the United States, during World War II; accidentally drowned at Boulder Lake, May 15, aged 29, while fishing.

John Leslie Murphy, El Paso, Texas; University of Michigan Medical School, Ann Arbor, 1928; diplomate of the National Board of Medical Examiners; fellow of the American College of Surgeons; on the staffs of the City-County Hospital, Hotel Dieu, Sisters' Hospital and the Southwestern General Hospital; died May 2, aged 44.

James Anthony O'Connor ⊕ North Tonawanda, N. Y.; University of Buffalo School of Medicine, 1919; served during World War I; for many years associated with the De Graff Memorial Hospital; died April 9, aged 49, of nephritis and hypertension.

Elmer Benjamin Packer, Toulon, Ill.; Jefferson Medical College of Philadelphia, 1899; served during World War I; member of the city council and board of education; affiliated with the Kewanee (Ill.) Public Hospital; died May 27, aged 82, of diabetes mellitus.

Howard Simmons Paine, Miami, Fla.; Albany (N. Y.) Medical College, 1881; fellow of the American College of Surgeons; for many years on the staff of the Glens Falls (N. Y.) Hospital; died May 5, aged 90, of pneumonia.

Dominick Andrew Palmisano ⊕ New Orleans; Medical Department of Tulane University of Louisiana, New Orleans, 1913; on the staffs of the Eye, Ear, Nose and Throat Hospital, Hotel Dieu, Women's Dispensary and Charity Hospital; died April 21, aged 59.

Walter Edward Patrie, Blackfoot, Idaho; Ensworth Medical College, St. Joseph, 1899; member of the American Medical Association; served overseas during World War I; for many years county health officer; died May 18, aged 69, of coronary occlusion and hypertension.

Richard Sebastian Pearse, Brooklyn; New York Homeopathic Medical College and Hospital, New York, 1902; served in France during World War I; died in the Kings County Hospital April 19, aged 71, of cerebral thrombosis and hypertensive cardiovascular disease.

George Winchester Penn, Humboldt, Tenn.; Vanderbilt University School of Medicine, Nashville, 1884; died May 20, aged 82, of coronary thrombosis.

George Emery Percy, Salem, Mass.; Boston University School of Medicine, 1879; died May 28, aged 88, of arteriosclerosis and heart disease.

Sophus George Peterson ⊕ Rutland, Ill.; Rush Medical College, Chicago, 1897; served on the school board; served on the staff of St. Mary's Hospital in Streator; died May 5, aged 72, of coronary thrombosis.

Willis Staats Pomeroy, Gallupville, N. Y.; Kentucky School of Medicine, Louisville, 1904; died April 20, aged 75, of osteoarthritis, gangrene of both legs and arteriosclerosis.

Louis John Porstmann, Davenport, Iowa; Barnes Medical College, St. Louis, 1898; member of the American Medical Association; served on the staff of the Mercy Hospital; died in the Henry Ford Hospital, Detroit, May 21, aged 82, of cerebral thrombosis.

Ulysses Grant Powers, Evanston, Ill.; Medical College of Indiana, Indianapolis, 1894; died May 17, aged 82, of angina pectoris.

Peter James Reynolds, Dwight, Ill.; Rush Medical College, Chicago, 1894; affiliated with St. Mary's Hospital in Streator; died in Chicago June 6, aged 77, of coronary thrombosis.

Valentin Rothermel, Chicago; Friedrich-Wilhelms-Universität Medizinische Fakultät, Berlin, Prussia, 1923; died May 22, aged 53, of carcinoma of the rectum with metastases.

William Sidney Rowles, Hudson, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1940; interned at the Bellevue Hospital in New York; served a residency at the Greenwich (Conn.) Hospital; affiliated with the Veterans Hospital in Newington, Conn.; served during World War II; died in Stockport May 31, aged 32, of a fractured skull received in an automobile accident.

Charles Edwin Schlappich, Birdsboro, Pa.; Baltimore Medical College, 1908; member of the American Medical Association; served as chief deputy coroner, president of the board of health and director of the First National Bank; on the staff of St. Joseph Hospital in Reading, where he died May 14, aged 65, of injuries received in an automobile accident.

A Course on Infectious Diseases

Dr. L. Zamorano, head of the pathology department at the National Hospital for Infectious Diseases, has just given a course on infectious diseases in the Institute of Medical Pathology directed by Dr. Gregorio Marañon before large audiences of physicians and students. His lectures, which are to be published, were magnificent, especially those dealing with atypical pneumonia, sepsis, typhoid and salmonellosis. In the talk on exanthematic typhus, he spoke from experience in the latest epidemic in Madrid, where he studied 42 postmortems from the points of view of anatomy and histology and found, in addition to the typical lesions already described by others, further nonspecific lesions which were related to the symptomatology (myocarditis, encephalitis, hepatitis). In another paper, on visceral leishmaniasis, he described certain granulomatous formations in the lung very similar to miliary tuberculosis but without any caseation and with Donovan bodies inside the macrophages, which he was the first to call attention to. Dr. Zamorano's fellow workers in this course of lectures on infectious diseases were Drs. A. Duque Sampayo (circulatory system and infectious diseases), F. Vega Diaz (endocarditis lenta), E. Lopez Vidriero (diphtheria), J. Martinez Diaz (poliomyelitis), J. Gimena (brucellosis), L. Arteta and Professor Marañon, who gave the closing lecture, "the febricular syndrome," in which he gave a review with especial reference to his recent findings in connection with hypothalamic and endocrine syndromes in general.

Institute of Medical Research

Dr. C. Jimenez Diaz, professor of internal medicine in the Faculty of Medicine of Madrid University, took steps in 1934 to set up an institution for clinical investigation, with the financial support of private capital, and he succeeded in organizing an Institute of Medical Research which opened in the Madrid University City in July 1936. The outbreak of the civil war immediately afterward interrupted the work planned, because the University City was right on the battlefield throughout the three years of war. Already the institution had been included in the University of Madrid and two floors had been allotted to it.

Some of the institute's earliest collaborators are now in exile working in other research centers: Dr. Severo Ochoa is now professor of pharmacology in University College, New York; Dr. Felipe Moran now works in the Médical Clinic of the Railway Hospital at Buenos Ayres; Dr. F. Bielschowsky is engaged in a scientific center at Sheffield, England.

After the civil war Professor Jimenez Diaz gathered his collaborators together again in a new building where, so far, useful work has been done. A number of new men have joined Professor Jimenez Diaz. At present they are functioning in the institute sections of physiology under Dr. Francisco Grande Cobian, biochemistry under Dr. H. Castro Mendozoa, bacteriology and immunology under Dr. Emilio Arjona and experimental pathology under Dr. P. De La.Barreda. Affiliated with this institute are the hospital services directed by Professor Jimenez Diaz, of which the heads are Drs. J. Rof Carballo, E. Lopez Garcia and J. Parra Lazaro, with subsections attached to them.

The institute was entrusted by decree of the director general of public health in 1941 to study problems connected with feeding the Spanish people and, by ministerial order issued since the war, it has become a part of the Cajal Trust of the Higher Council for Scientific Research. Studies have been made on lathyrism, metabolism of the lipoids, the lipotropic action of choline, allergy and other subjects. With Dr. F. De Castro's collaboration they have proved that the experimental muscular dystrophy produced by avitaminosis E corresponds to an alteration of the myoneural synapsis (increase of cholinesterase in the muscles of dystrophic rabbits). P. de la Barreda is now focusing attention on experimental hypertension, and recently they have found that the artery wall plays a part in hypertension, producing an enzymatic substance which, when acting on the blood plasma, gives rise to a hypertensive principle. This fact has been designated by C. Jimenez Diaz in a recent paper as "internal secretion of the arteries."

Dr. F. Grande Cobian and Dr. Oya have done work on the metabolism of carbohydrates and the importance of certain intermediary products (pyruvic acid and citric acid) in their utilization. These papers have appeared in the *Anales del Instituto de Investigaciones Médicas* and are republished, as they come out, in the *Revista Clinica Española.*

Anti-Insulinic Substances of Pancreatic Origin

In the Institute of Experimental Medicine of the Higher Council for Scientific Research Dr. J. L. Rodriguez-Candela, along lines which he started with Dr. L. Bauman at Columbia University, is working on the possible existence of anti-insulinic substances of pancreatic origin. He proved, seven months before Thorogood, that dogs with alloxanic diabetes require much more insulin to compensate their diabetes than after the removal of the pancreas. He has proved in a second experiment that this is not due to any disturbance in the absorption of nutritive elements, since, if we tie the pancreatic ducts in a dog with alloxanic diabetes, the animal does not vary in weight and does not need more insulin if pancreatic ferments are administered (the author gives raw pancreas); if, after some time, when the islet pancreatic tissue has become atrophied, the whole of the remaining pancreas is removed, he observes that the need of insulin diminishes. In a later paper he shows that this anti-insulinic activity is stimulated by acetylcholine. He has ascertained that the ocular complications of alloxanic diabetes are not due to lack of insulinic compensation; they are due to a modification of the plasma proteins (beta-globulins), with a lessening of the complementary power of the serum, which may explain why diabetic patients have so little resistance to infection. This lessening of the complementary power of the serum improves after the administration of amino acids, and even more, after that of a pancreatic extract devoid of hypoglycemic activity. Dr. J. L. Rodriguez-Candela's papers have appeared in volume 29 of the *Anales de la Academia Medico-Quirurgica Española* (1945-1946), and the latest ones have come out in the *Revista del Institute Nacional de Ciencias Medicas* (Madrid).

Studies on Tuberculosis

Professor M. Tapia, for many years director of the National Hospital for Infectious Diseases (formerly Hospital del Rey), left Spain during the civil war and went to Portugal, where he has been carrying out studies on tuberculosis at the Caramulo Sanatorium. A product of his studies in Portugal is the book Formas Anatomoclinicas, Diagnostico y Tratamiento de la Tuberculosis Pulmonar (Porto, Artes Graficas, 1939, and two later editions). It is probably the most complete tome in the world on tuberculosis and it is a subject of pride for us that it is written in Spanish.

After several years' residence in Portugal, he has been allowed to come to Spain several times; on his latest two visits he lectured on tuberculosis. The first lecture was entitled "Extrapleural Pneumothorax" and the second "Tracheobronchial Tuberculosis." These have been mentioned in a previous letter.

His latest book, La tuberculosis traquobronquial (Lisbon, Livraria Luso-Española, 1946), is the first contribution in Spanish to our knowledge on the subject. He sets forth the part played by bronchial tuberculosis in the various stages of tuberculosis of the respiratory tree, its symptomatology and its treatment. He devotes a chapter to bronchial tuberculosis in relation to collapsotherapy and indicates with great precision the conditions in which bronchial tuberculosis is a decisive factor and what treatment should be followed. The book is enriched with many clinical records from Caramulo, and tomographic pictures, a method of radiologic examination by means of which he often establishes a precise diagnosis and is able to localize the bronchial lesions without resorting to bronchoscopy.

To our sorrow, this book was written in exile, and those of us who see Dr. Tapia coming and going deeply regret that he has not accepted the invitation extended by the Spanish authorities to take up his post again as director of the National Hospital for Infectious Diseases.

TURKEY

(From Our Regular Correspondent)

ANKARA, July 10, 1947.

The New University Law

With the enactment of the university law in June 1946 universities in Turkey became independent, self-governing institutions. When the Istanbul University, which had functioned since 1909, was reorganized in 1933 it retained its scientific freedom but lost its independence and self government and came under the jurisdiction of the Ministry of Education, which from then on decided on matters of administration, the appointment of the faculty, changes therein, the curriculum and other matters of instruction. As a result of the dynamic leadership and the untiring efforts of its president (1943-1946), Dr. Tevfik Saglam, who drafted the bill and introduced it through the Ministry of Education, it recovered its independence and made the other universities self-governing bodies.

The law has eighty-one articles. It determines the president, the senate, the faculty, the committees, the relationship of departments to other universities, the status of the faculty members engaging in private practice, indemnities, duties of assistants, instructors and interpreters, matters of discipline, employees, governmental control and matters of finance.

There are three universities in Turkey, the Istanbul University, the Istanbul Technic University and the Ankara University. At its inception in 1909 the Istanbul University consisted of the Medical School, the School of Law, the School of Literature, the School of Mathematics and the School of Theology, the latter becoming extinct with the advent of the republic. Founded in 1827, the Medical School is the oldest. The School of Political Science was established in 1866 and is a separate institution. The Istanbul School of Engineering, which was established in 1872, has been a separate university for the past five years. The Ankara University comprises the Medical School, the School of Law, the School of Literature and the School of Science. The School of Political Science at Ankara and the Ankara Conservatory are independent institutions; so are the Schools of Commerce and Economics at Istanbul and Smyrna. A bill has been introduced which will give university status to the Ankara Institute of Agriculture, which includes the School of Agriculture, the Veterinary School and the School of Forestry.

During 1946-1947 the Istanbul University had an enrolment of 11,158, of which 3,077 were medical, 2,394 law, 2,171 science, 2,130 literature, 1,068 economics, 161 pharmacy and 157 dentistry students. Of the medical students 261 are taking the one year preparatory course in physics, chemistry and biology at the School of Science; the remaining 2,916 are taking the five year course at the Medical School; of these 1,472 are civilians and 312 are women; 714 students are living at the student homes provided by the Ministry of Health. At the homes they receive free board and maintenance, are provided with every article of clothing and all textbooks and receive a monthly allowance and free tuition, in return of which they are to serve the government after graduation; 318 students are living at the dormitories provided by the army medical corps.

According to the new law an indemnity is granted professors who abstain from engaging in private practice. A full time professor receives 400 pounds in addition to his monthly salary, a full time associate professor 300 pounds and a full time assistant professor 200 pounds. At official occasions university professors follow the supreme court, the council of state and the court of finance and precede all ministries. University professors are not subject to the age limit; if their physical and mental condition permits, they may teach until 70 or 75 years of age. The Istanbul University 1947 budget is 11,622,501 Turkish pounds, on the staff are 99 Turkish and 36 foreign professors, 98 assistant professors, 269 assistants, 34 lecturers, 6 interpreters at the disposal of the foreign professors, 5 monitors, 11 foreign lecturers, 21 foreign technicians and 3 instructors, a total of 582 staff members; of these the Medical School has 41 Turkish and 6 foreign professors, 33 assistant professors and 120 assistants. The three classes of the Ankara University Medical School established in 1945 consists of 235 civilians, 39 women, 101 students at the dormitory of the Ministry of Health and 165 army medical students.

Sources of income of university, faculty and university unions and organizations are (*a*) government appropriations, (*b*) provincial and municipal appropriations and appropriations from societies, (*c*) fees derived from organizations affiliated with the university or a faculty, (*d*) fees derived from societies or persons engaged in research or consultation at the university, faculty or affiliated institutions, (*e*) income derived from publications, (*f*) the income from property in real estate owned by the university, faculty or affiliated institutions, (*g*) income from institutes, laboratories, clinics and outpatient departments, (*h*) income from profits made in investments, (*i*) donations and bequests.

Every year the ministries concerned in cooperation with the ministry of education and in consultation with the universities decide on the number of students to be admitted either as dormitory students or as students receiving a scholarship and on qualifications of these students other than general, which have to be published one month in advance of registration. All expenses such as registration fees, tuition fees and fees for board and maintenance, laboratory and examination fees and fees for diplomas of university dormitory or scholarship students are to be borne by the respective universities or administration.

Under the presidency of the minister of education the president and dean of each university elect from among their group for a duration of two years a member to the senate of each university. The report on the senate is to be made by one of the general secretaries of the university where the senate is in session and who has been charged with this duty by the minister of education, who, if need arises, indicates the locality where the senate is to meet.

The minister of education is in supreme authority over all the universities. Presiding over the interuniversity council, he exercises governmental control over the universities, the faculties and the committees; he investigates and approves matters relating to universities and faculties and if necessary recommends reexamination of decisions.

In agreement with the general assembly of faculty professors, the president has authority to entrust professors, associate professors and assistant professors to pursue scientific investigations or temporarily engage in research work at another university within the country or abroad either personally or as a director of scientific or professional matters.

BUENOS AIRES

Resignations and Retirements in the Faculties of Medicine

The following titular professors resigned their chairs in the Faculty of Medical Sciences of Buenos Aires: Drs. Alberto Zwanck (hygiene), Neiro Rojas (legal medicine), Mariano R. Castex (clinical medicine), Alberto Peralta Ramos (obstetrics) and Juan P. Garrahan (pediatrics) and retired. Drs. Nicholás Romano (clinical medicine) and Pedro Baliña (dermatology and venereal diseases), among others, were asked to resign.

In the Faculty of Medicine of Rosario the following titular professors, among others, were removed from their chairs: Drs. David Staffieri (clinical medicine), Juan M. González (pathology), Juan T. Lewis (physiology), Enrique Roncoroni (anatomy) and J. M. M. Fernández (clinical dermatology).

The Federation of Organizations for the Defense and Progress of the Autonomic Democratic University prepared an alphabetical list of professors and auxiliary docent teachers of the six national universities who retired or were either declared "in cessation" or resigned during the period which began on the date of intervention in schools by the law of May 3, 1946. The list includes more than 1,150 professors and auxiliary personnel belonging to the following faculties: the Faculty of Medical Sciences of the University of Buenos Aires, 10 who were declared in cessation, 9 who retired and 28 who resigned; from the University of Cordoba, 8 in cessation, 4 who retired and 137 who resigned; from the University of La Plata, 9 who retired, 6 who resigned and 2 who were removed from their chairs; from the University of Litoral (Rosario), 14 who were declared in cessation and 322 who resigned. The list includes, with respect to the University of Buenos Aires, only professors and not auxiliary docent personnel.

Among the 26 titular professors of medicine and odontology recently appointed in Buenos Aires are Drs. Juan M. Muñoz (physiology), Manuel L. Pérez (clinical obstetrics, normal parturition), José W. Tobias (clinical medicine, fourth chair), Saúl I. Bettinotti (puericulture, early infancy), Juan R. Beltrán (legal medicine) (consequently he renounced his chair of history of medicine), Enrique D. U. Pierángeli (clinic of nutrition), Ricardo E. Dónovan (surgical pathology), Fernando M. Bustos (surgical clinic, third chair), Adolfo F. Landivar (surgical clinic, first chair), Antonio R. Vergara (clinical otolaryngology) and Germinal Rodríguez (hygiene and social medicine).

Institute of Medical Investigation

The Institute of Medical Investigation for Promoting Scientific Medicine, which is a private institution supported by well-to-do persons of Córdoba, was recently inaugurated in Córdoba City. It is devoted to investigation on the basic branches of medicine for purely scientific purposes. Its creation is due to the separation of Dr. Oscar Orías from his chair of physiology of the Faculty of Medical Sciences of Córdoba as well as of his collaborators because of the separation of Professor Houssay, of whom Dr. Orías was a pupil.

Drs. Oscar Orías and Enrique Moisset de Espanés are director and subdirector respectively of the institute, which has sections on pharmacology, chemistry, histology and optical recording of cardiovascular activity. Studies are now available on cardiovascular physiology under the direction of Dr. O. Orías, on pharmacology, especially on active principles of autochthonous South American plants, for instance fagarine (see The Journal March 12, 1946 and Jan. 18, 1947) under the direction of Dr. E. Moisset de Espanés, on the sexual and reproductive aspects of endocrinology under direction of Dr. Inés L. C. de Allende, and on the physiopathologic mechanism of allergy under the direction of Dr. L. Giscafré.

This institute is the second of its type. The first one was created in Buenos Aires in 1944 under the direction of Professor B. A. Houssay. The latter was created for the same reasons as the former. There were speeches at the inaugural ceremonies. Dr. B. A. Houssay spoke on "Scientific Investigations in Argentina." He said that fundamental scientific investigations are developed in universities or else in private or industrial institutions. The best progress is obtained in the last two, which offer the possibilities of working free from bureaucratic obstacles. The opening of the new institution is an important event in Córdoba, a city of unusual intellectual culture and the cradle of the first university of Argentina.

Examination of Pregnant Women for Tuberculosis

Through a law of the Buenos Aires municipality pulmonary x-ray examination of pregnant women for tuberculosis is to be obligatory and free of any cost to the patients. The examination will be performed on pregnant women who report for the first consultation to the consulting offices of municipal maternity hospitals. The proposed measures are of great value in the crusade against tuberculosis, as they offer proper treatment to tuberculous pregnant women and their babies. From now on tuberculous patients will occupy special sections of municipal maternities.

BRAZIL

(From Our Regular Correspondent)

São Paulo, July 16, 1947.

Antineoplastic Action of a Fungus

Before the Sociedade Medica São Lucas, Dr. Juvenal R. Meyer of the Instituto Biologico de São Paulo referred to the antineoplastic action of the adult form of Polyporus cinnabarinus, called by Brazilian people "orelha de pau" (ear of wood). This property is similar to the antineoplastic action found by the same author in cultures of Penicillium notatum according to a paper read some time ago before the same society, in which he pointed out the characteristics of the active substance against a transplantable tumor of the mouse.

The reproduction of this type of tumor is prevented by an aqueous extract of Polyporus cinnabarinus, while pieces of the same tumor treated under the same temperature (4 C.) during an equal period of time (seventy-two hours) maintained all their neoplastic activity.

The aqueous extract is prepared by boiling 1 part of the adult forms of the fungus with 5 or 6 parts of water for five to ten minutes. Its activity is maintained from four to six days at a temperature of 4 C. and after treatment by heat at 98 C. for thirty minutes. This antineoplastic activity is partially or completely lost when the aqueous extract is treated by animal proteins or by alkaline solutions. This may be the reason for the antineoplastic decreasing action when the extract is injected into mice bearing the tumor; it enters into contact with animal proteins before reaching the tumor.

An Indian doctor has published a paper on similar action shown by a fungus, perhaps the same Polyporus cinnabarinus that exists in Brazil.

Dr. Morris Fishbein in São Paulo

During his short visit in São Paulo Dr. Morris Fishbein of Chicago visited the Hospital da Santa Casa de Santos on July 6, the Asilo Santa Terezinha de Carapicuiba and the Escola Paulista de Medicina on July 7. Dr. Fishbein also visited the Hospital das Clinicas, the Faculdade de Saude Publica and the Instituto Pinheiros and in the evening addressed the Associação Paulista de Medicina on the theme "One Hundred Years of Medical Progress."

AUSTRALIA

(From Our Regular Correspondent)

May 26, 1947.

Medical Service in Australia

The introduction of a scheme for nationalization of medicine in Australia, while costing £45 million yearly, would break no new ground in the field of health. At best it might extend the scope of treatment offered people unable to pay or living in isolated areas. The government could, however, render valuable service at comparatively low cost by branching out in the direction of positive or protective health. At present, such expenditure is insignificant. Most of the organizations set up in this field have insufficient funds to be fully effective. These are the views of the economic adviser to the Queensland government, published in the *Economic News*, a monthly bulletin issued by the Queensland Bureau of Industry.

Private activities (with governmental subsidies) have been able to provide adequate medical treatment and health insurance facilities, but they have neither the power nor the scope to provide positive or protective measures. These must be developed by impersonal public authorities. Therefore this should be the first avenue for increased public activities. This would reduce the need for hospitals and medical care until the time arrives when economic conditions will permit the large expenditure that will be necessary for the socialization of all medical activities. Extensions in this field should include the elimination of substandard housing, large scale schemes for the eradication of mosquitoes and other pests and the elimination of earth closets. Some local authorities have already done splendid work in this field, but it is not nearly far reaching enough. Also diagnostic facilities to assist in checking the development of disease might be established. Experience in the late war showed the value of universal low cost x-ray examinations and periodic medical checks. Such a scheme applied to the whole community would result in the early notification of dangerous symptoms and the checking of disease. This might be done in schools, universities, factories and shops. A national scheme, when it is introduced, must be comprehensive. Charges made against the British scheme are its failure to provide appliances and artificial units, nursing and specialist services, and to cover maternity; also its excessive limitations on the prescription of drugs. The detailed organization of any national medical scheme adopted is a matter for consultation and determination by those who have had professional experience. However, to the layman the most advantageous system seems to be one wherein the patient's contact with the doctor is through a group clinic working in conjunction with laboratory specialists, general hospitals staffed by specialists, and less expensively equipped hospitals for subacute, convalescent and chronic cases. This system offers the patient a free choice of, say, fifteen to twenty doctors and enables consultations to be held with specialized doctors without additional visits. It offers doctors adequate laboratory and research facilities and avoids excessive expenditure on equipment, since the apparatus installed in hospitals now restricted to serious cases would be more fully utilized.

Institute of Dental Research in Sydney

Out of the appointment of a director of the laboratories of pathology, bacteriology and biochemistry to the United Dental Hospital, Sydney, in August 1946, has grown the Institute of Dental Research. The Hospitals Commission of New South Wales has provided £5,000 to establish and equip the institute, the objects of which are to promote research in dental science and a focus for the scientific activities of dentistry. The library covers all branches of medical and dental science. One of the functions of the library is a discussion group. A routine pathologic service for the dental hospital is provided. This service is available also to the general dental practitioner, who will be able to have complete laboratory examinations made for his patients.

A paper on the relation between exposed pulps and infection by the poliomyelitis virus has been published by the institute. Several others on the relation between oral bacteria and dental caries and its relation to Australian dietaries is proceeding; and an inquiry is being made into a technic for serologic identification of oral strains of yeast.

The institute is not under any financial burden for the current year, but any expansion of its activities will depend on the availability of a considerably increased income.

Graduate in Social Studies Appointed to Hospital

The first appointment of a graduate in social studies to a Queensland public hospital has been made. The appointee will be responsible for following up the medical history of children after their discharge from the hospital and will assist in attempting to find the causes of diseases produced under various economic and domestic conditions. She will assist in finding accommodation for parents of sick children who come from country districts and will investigate school records of certain types of children. It is proposed to introduce into the Queensland University next year a course in social studies which will cover economics, philosophy, history, industrial relations, physiology, nutrition and lectures on existing facilities for social service work.

New Record Low for Infant Mortality

New Zealand has established a new world's record for the mortality of infants during the first year of life. For 1946 the rate was 25.35 per thousand live births. Queensland also has a new low record for the state. For 1945 the rate was 29.67 per thousand live births. For 1944 the rate was 31.32 and in 1943 it was 37.79. For Australia the 1945 rate was 29.4. For comparison, the Australian infant mortality rates have been 115.3 for 1891, 103.6 for 1901, 68.5 for 1911, 65.7 for 1921, 42.1 for 1931 and 39.7 for 1941.

Personal Items

Dr. A. J. Canny, former senior pathologist and acting director of the Kanematsu Institute of Pathology, Sydney Hospital, has been appointed to the chair of pathology, University of Queensland.

Dr. W. Simmonds, lecturer in pathology at the University of Queensland, has been awarded a Nuffield demonstratorship in physiology at the Oxford Medical School. The appointment is for three years, for which period Dr. Simmonds has been granted leave of absence.

Mr. G. P. S. Boissard, B.Sc., lecturer in physiology, has resigned following the award to him of the Bayliss-Starling studentship (1946-1947) by the University College, London.

Dr. W. A. Wunderly has been appointed director of the new tuberculosis division of the commonwealth department of health. He has studied extensively in Europe and North America.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Naturopath as "Duly Licensed and Practicing Physician" Within Meaning of Sickness Insurance Policy.—The plaintiff sued for actual and punitive damages alleged to be due because of the defendant's failure to make weekly indemnity payments under a sick benefit policy. From a judgment for the plaintiff, the defendant appealed to the Supreme Court of South Carolina.

The policy written by the defendant insurance company agreed to pay the plaintiff weekly sickness benefits on the conditions stated in clause 6 of the policy, namely "Weekly benefits for sickness will be paid for each period of seven consecutive days while the insured is totally disabled by sickness from performing or giving any attention whatever to his or her usual or other occupation; and necessarily confined to bed and there visited professionally by a duly licensed and practicing physician. A certificate must be furnished by the insured and signed by the physician at the beginning of each week of such disability, setting forth the nature of illness and probable duration."

The matter came before the court on exceptions which raised the single question of whether or not the plaintiff complied with the aforementioned provision of the policy requiring attendance "by a duly licensed and practicing physician" and the issuance of a certificate by such physician at the beginning of each week of the alleged disability. The evidence showed that plaintiff was attended by a practitioner of that school of medicine which is known as naturopathy and that the required physician's certificate on which the plaintiff based his claim was signed by such practitioner. It is the defendant's contention that such a practitioner is not a "duly licensed and practicing physician" within the meaning or contemplation of the provision quoted.

At the time the plaintiff's claim arose, said the Supreme Court, the practitioner in question was certainly a "naturopathic physician" within the specific language of the South Carolina statutes enacted in 1937 which permit the practice of naturopathy in the state. He was practicing his profession within the indicated field and in the absence of anything in the record to show the contrary, he must be deemed to have been duly licensed. He was, then, a duly licensed and practicing naturopathic physician and was therefore an eligible or qualified practitioner to sign the certificate required by defendant's policy, unless the fact that he was a naturopathic physician, instead of merely a "physician," disqualified him. Naturopathy, continued the court, is one of a number of fields in the art of healing which have been recognized by the general assembly as accepted processes of preventive and curative medicine. Any one engaged in the practice of any of such branches of medicine, after having been duly licensed, stands for all purposes in the position of a physician in the orthodox field of medicine, at least to the extent that he limits his activities to the recognized scope of his particular profession. An osteopath, a homeopath, a chiropractor, a magnetic healer and a naturopath are alike practitioners in the field of medicine, and it appears to us, concluded the court, to be straining at a gnat to enter into a discussion of distinctions between a "practitioner of medicine" and a "physician."

Having regard to the various specialties in the field of medicine recognized by the general assembly, including naturopathy, and to the unwillingness of the defendant to accept the certificate of a naturopath, it may be that the defendant can make special provisions in its policies requiring that claims will be paid only when certified by practitioners who are licensed in the field of materia medica, major surgery, and etc. And they might except from their policies any liability arising out of, or concurrent with, the violation by a naturopath or other practitioner of the limitations of his profession. But there are no such limitations in the present policy. At most there is an ambiguity arising out of the use of the word "physician" when the defendants might have used a term of more limited significance.

In conclusion, the court said that, while this is not in any sense controlling, we may advert to the fact that it is a matter of common knowledge that the people who purchase sick benefit policies of the industrial type constitute a large proportion of the patrons of practitioners of such branches of healing as naturopathy, and that it is generally believed by such people that they are dealing with licensed practitioners of medicine. In this belief they are encouraged by legislation authorizing such practice. It would be unjust, under such circumstances, to deprive these people of contract rights by means of a limitation on the meaning of the word "physician" to exclude the types of medical practice which to them are acceptable. Accordingly the judgment in favor of the plaintiff was affirmed.—*Williams v. Capital Life & Health Insurance Company, 41 S. E. (2d) 208 (S. C., 1947).*

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS EXAMINING BOARDS IN SPECIALTIES

Examinations of the National Board of Medical Examiners and the Examining Boards in Specialties were published in The Journal, Aug. 2, page 1198.

BOARDS OF MEDICAL EXAMINERS

Arkansas:* *Examination.* Texarkana, Nov. 6-7, 1947. Sec., L. J. Kosminsky, Texarkana.

Arkansas: *Eclectic.** Little Rock, Nov. 6. Sec., Dr. Clarence H. Young, 1415 Main St., Little Rock.

California: *Written.* Los Angeles, Aug. 25-28. *Oral.* Los Angeles, Nov. 8-9. Sec., Dr. Frederick N. Scatena, 1020 N. St., Sacramento 14.

District of Columbia:* *Endorsement.* Washington, Sept. 8. Sec., Commission on Licensure, Dr. G. C. Ruhland, 6012 Municipal Bldg., Washington.

Georgia: Atlanta, Oct. 14-16. Sec., Mr. R. C. Coleman, 111 State Capitol, Atlanta 3.

Illinois: Chicago, Oct. 14-16. Supt. of Registration, Dept. of Registration and Education, Mr. Philip M. Harman, Springfield.

Indiana: *Examination.* Indianapolis, June 1948. Sec., Board of Medical Registration and Examination, Dr. Paul R. Tindall, K of P Bldg., Indianapolis.

Kentucky: *Examination.* Louisville, Sept. 22-24. Sec., State Board of Health, Dr. P. E. Blackerby, 620 S. Third St., Louisville 2.

Minnesota:* St. Paul, Sept. 3-5. Sec., Dr. J. F. DuBois, 230 Lowry Medical Arts Bldg., St. Paul.

Mississippi: *Endorsement.* Jackson, Dec. 1947. Asst. Sec., State Board of Health, Dr. R. N. Whitfield, Jackson.

Montana: Helena, Oct. 6-8. Sec., Dr. O. G. Klein, First National Bank Bldg., Helena.

Nevada: Carson City, Nov. 3. Sec., Dr. G. H. Ross, 215 N. Carson St., Carson City.

New Hampshire: Concord, Sept. 11-12. Sec., Board of Registration in Medicine, Dr. John S. Wheeler, 107 State House, Concord.

New Jersey: *Examination.* Trenton, Oct. 21-22. Sec., Dr. E. S. Hallinger, 28 W. State St., Trenton.

New Mexico:* Santa Fe, Oct. 13-14. Sec., Dr. LeGrand Ward, 141 E. Palace Ave., Santa Fe.

New York: *Examination.* Albany, Buffalo, New York and Syracuse, Oct. 6-9, 1947. Sec., Dr. Jacob L. Lochner, Jr., Education Bldg., Albany.

Rhode Island:* *Examination.* Providence, Oct. 2-3. Chief, Division of Professional Regulation, 366 State Office Bldg., Providence.

South Carolina: Columbia, Nov. 10-12. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

Utah: *Reciprocity.* Oct. 8. *Examination.* Salt Lake Ctiy, June, 1948. Asst. Dir., Department of Registration, Miss Rena B. Loomis, 324 State Capitol Bldg., Salt Lake City.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Journal of Physiology, Baltimore

Id: XII. Poliomyelitis Convalescent Treatment and Related Subjects. R L Bennett—p 476

Peritoneal Irrigation for Uremia Resulting from Incompatible Blood Transfusion.—Muirhead and his associates report a case of uremia following acute renal damage due to an incompatible blood transfusion The prognosis seemed poor until the procedure of peritoneal irrigation was instituted according to the technic of Frank, Seligman and Fine. The amount of urea cleared from the body by this procedure was comparable to that reported by these observers. The urea clearance was taken as a measure of the clearance of other substances. Overhydration constituted one of the main complications, as the kidneys were not able to discard water. This complication was accentuated by the use of Tyrode's solution and isotonic solution of three chlorides in the peritoneum. Recovery was associated with loss of water and salt from the body, while dextrose in distilled water was used for peritoneal irrigation. Substantial amounts of urea were obtained by this method, and the azotemia was greatly relieved. Subsequently the kidneys cleared large quantities of urea from the body, but polyuria was necessary, as the urea clearance remained depressed

Surgical Treatment of Peptic Ulcer.—Thompson and Prout report the results of surgical treatment of peptic ulcer in the Los Angeles General Hospital. The study covers the two and one-half year period from Jan 1, 1943 through June 30, 1945 During that time the diagnosis of peptic ulcer was made on 1,415 hospitalized patients. Of this group 1,108 patients, or 78 per cent, received medical treatment, and 307 patients, or 22 per cent, were treated surgically. This study was made by the method of sampling 100 unselected cases wherein acute perforation was the indication for surgical treatment and 50 unselected cases wherein elective operations were performed. The latter surgical procedures included partial gastrectomy, anastomotic operations and total gastrectomy. An overall mortality rate of 19.3 per cent does not appear too bad in the light of mortality figures of the past. The application of gastric resection, partial or total, in 86 per cent of the cases illustrates the trend toward radical operation in the treatment of peptic ulcer. Admittedly less effectual procedures such as gastrojejunostomy and gastroduodenostomy were, moreover, accompanied with higher mortality figures, being 25.5 per cent and 42.8 per cent respectively.

*Anatomicophysiologic Aspects of Injuries to Intervertebral Disk. V. T. Inman and J. B deC M. Saunders.—p. 461.

Laminectomy and Foraminotomy.—Briggs and Keats treated 18 patients (8 females and 10 males aged between 13 and 53 years) surgically for the relief of backache and leg pain associated with spondylolisthesis In 9 patients who presented no history of leg pain, the operation consisted in excision of the unfused laminas followed by a modified chip fusion. The second group of 9 patients included those who had pain of sciatic radiation in addition to low back pain indicative of nerve root involvement; in these patients the operation consisted in laminectomy, intervertebral foraminotomy and surgical fusion. The technic of the operation was concerned with two principal problems: first, stabilization of the weak link in the spinal column to relieve tension and strain on the associated muscles and ligaments and to prevent further progression of the subluxation and, second, relief of the nerve root oppression responsible for the sciatic pain. All the 9 patients of the first group were relieved of pain and were able to return to work. Nerve root pressure was accounted for by a protruded intervertebral disk in only 1 of the 9 patients of the second group; the remaining 8 patients were relieved of pain when the involved intervertebral foramens were unroofed. The greatest permanent benefit and the most dramatic relief of pain is offered by a combination of laminectomy, intervertebral foraminotomy and chip fusion.

End Result Study of Intervertebral Disk.—Lenhard studied 843 patients operated on for removal of an injured intervertebral disk. Five hundred and sixty-six (67 per cent) of the patients were men and 277 (33 per cent) were women. The operation afforded good results in 67.5 per cent of the patients examined. In those not examined but surveyed by questionnaire, apparently good results had been obtained in 59.5 per cent. Twenty patients required multiple operations for recurrences in a series of 147 who returned for examination. Roentgenographic interpretations are not reliable for accurate localization of the lesion.

Ruptured Intervertebral Disk and Sciatic Pain.—Barr reports the results of operations on 380 patients for ruptured intervertebral disk pressing on one or more of the nerve roots of the lumbosacral plexus and causing low back and intractable sciatic pain during the five year period 1939 to 1943. End results were obtained for 139 patients on questionnaire only and for 95 patients on questionnaire and check-up examinations, these 234 patients include 102 with spine fusion and 132 without spine fusion. Comparison of the results in these two groups seems to indicate a modest but definite superiority of the results in fused cases over the unfused ones when consideration is given to the factors of back pain and weakness, leg pain and weakness, and return to the type of work performed before the disability. One patient who had a spine fusion died of massive pulmonary embolism twenty-seven days after the operation. The localization of ruptured intervertebral disk by contrast myelography and the technic of its removal by partial laminectomy have become standard procedures. The thesis that every patient should have a spine fusion done at the time of laminectomy is tenable. Conservative treatment should be tried for a time before resorting to operative intervention. The principles of rest and immobilization, adequate sedation during the acute phase of the process and later protection of the lower part of the back from undue strain and postural rehabilitation appear to be the essential parts of a conservative regimen.

Pathologic Studies of Intervertebral Disks.—Eckert and Decker compared 182 intervertebral disks partially removed from 166 patients at operation with 40 lumbosacral intervertebral disks removed completely with their adjacent vertebral bodies from cadavers of different age groups at postmortem. It was apparent that the difference was in number rather than in kind. The principal changes encountered consisted of extensions of the tissue of the nucleus pulposus into the cartilaginous plate, vascularization of this defect, scarring with vascularization of the annulus fibrosus and nucleus pulposus, and granular degeneration considered the result of desiccation in the nucleus pulposus. At the time of the operation the disk was described as herniated, bulging or softened. No significant microscopic differences were found in the three groups. Follow-up studies on the surgical cases show good results in 86.7 per cent. The best results were obtained in those cases in which the disk was described at operation as herniated. No relation appears to exist between microscopic findings and end results.

Injuries to Intervertebral Disk.—Inman and Saunders divide their patients into three categories: 1. Patients with backache and local signs and symptoms of injury to the vertebral ligamentous structure presenting radiating pain, deep in character, extending down one or both extremities. Such patients should be considered as suffering from mechanical derangement of the spine and should be treated by immobilization and support. 2. Patients whose symptoms are identical with those found in the first group but who in addition give definite evidence of nerve root compression. Pain is relatively as prominent a phenomenon as the evidence of compression. Treatment should be directed toward the relief of pressure to prevent permanent damage to the affected nerve root. After removal of the herniated or displaced disk, additional measures are necessary to protect the injured and still painful ligamentous structures. 3. Patients whose symptoms of backache may be mild or lacking and in whom radiation of pain to the extremity is not extensive but signs of nerve compression are prominent. There is muscle weakness with atrophy, loss of sensation over the appropriate dermatome and reflex changes. Relatively few cases of herniated intervertebral disk fall in this category, but many of the spinal cord tumors do. Removal of the pressure agent and decompression of the nerve may be followed by almost complete dramatic recovery.

The Viral Pneumonias and Pneumonias of Probable Viral Origin. H. A. Reimann.—p. 167.

Detection of Genetic Carriers of Inherited Disease.—According to Neel two classes of people transmit inherited disease to their progeny: (*a*) those who actually have the disease and (*b*) those who appear normal but whose genetic constitution includes determiners for the disease. "Genetic carriers" are those who may transmit an inherited disease to their progeny without themselves showing it. The carriers of the majority of inherited diseases cannot at present be identified clinically and are known only through the results of a progeny test. However, the transmitters of certain inherited diseases exhibit minor departures from the norm which make it possible to identify them clinically with varying degrees of certainty. Of the twenty-two diseases mentioned as manifestations of carriers, eleven affect the blood or skin. This disproportionate representation of dermatology and hematology is probably not entirely due to chance but reflects the ease with which blood and skin can be studied. From the standpoint of the present accuracy of identification of the carrier state, the diseases which have been considered fall into three groups. For five of the diseases described—gout, xanthomatosis, thalassemia, sickle cell anemia and congenital hemolytic jaundice—the dia a carrier sta ay

Penicillin in Dementia Paralytica.—Smith administered calcium penicillin by intramuscular injection to 7 patients with dementia paralytica. Four patients had a first course of 20,000 units every three hours day and night for a total of 1,280,000 units, followed at an interval of a month or longer by a second course of 50,000 units every four hours day and night for a total of 2,400,000 units Two patients were given two courses of 50,000 units every four hours day and night until a total of 2,400,000 units had been given. The second course was given a month after the end of the first One patient had one course of treatment of 2,400,000 units. No penicillin was found in the spinal fluid with such dosage. A skin reaction developed in case 2, febrile reactions in cases 1 and 3, and Jarisch-Herxheimer reactions in cases 2 and 6. Serologic results in the spinal fluid were improved with regard to cells and protein, but the colloidal gold and Wassermann reactions were more resistant. The blood Wassermann reactions were unchanged. Clinical results have been encouraging: 4 patients have made a social recovery, 1 has greatly improved, 1 is not improved, and 1 died.

Propyl Thiouracil in Thyrotoxicosis.—Wilson and Goodwin summarize their experience with propyl thiouracil in treating 16 patients with thyrotoxicosis. The results with propyl thiouracil have shown that this drug is about four times as potent as methyl thiouracil. The response to propyl thiouracil is not more rapid than that to methyl thiouracil, and the maintenance dose is slightly greater for propyl thiouracil. Thyroid hyperplasia has not been observed with the doses used. Toxic effects on the skin were seen in 1 patient after seven weeks' treatment with propyl thiouracil. There is no evidence that propyl thiouracil has any particular advantage over methyl thiouracil.

Volume and Ventilation of Lungs Function Test. G. Birath—p. 717.

Toxicity of BCG Vaccine for Infected Persons.—According to Nègre and Bretey the oral introduction of BCG vaccine in three divided doses of 0 01 Gm each or in a single dose of 0.05 Gm. given by mouth to children and adults for prophylactic inoculation does not produce any immediate or delayed untoward reactions. BCG given in these doses has no effect on the course of tuberculous lesions in animal and man. It cannot activate latent foci in allergic persons. General or focal reactions are in general not associated with the treatment of the same types of patients with subcutaneous or intradermal injections of BCG. Mild and temporary rise of temperature of less than 1 degree may be observed in certain patients with tuberculosis during the days following these injections, but the lesions of these patients are not activated. Focal and general reactions can be produced in tuberculous patients with subcutaneous injections of larger doses (more than 1 mg.) than those used for vaccination. Repeated injections seem to make these reactions worse. Patients with pulmonary tuberculosis were not benefited nor was their condition made worse by the treatment with cutaneous scarifications which were impregnated with BCG. Unnecessary inoculation with BCG, particularly by the oral route or by cutaneous scarifications, will not produce toxic symptoms in allergic persons or in persons with latent lesions.

Schweizerische medizinische Wochenschrift, Basel

Electrical Accident as a Peculiar Biologic Phenomenon. S. Jellinek—p 407.
Sympathetic Regulation of Fibrinolysis. T. Halse.—p. 411.

Intestinal Form of von Recklinghausen's Neurofibromatosis.—According to Lindenmeyer, intestinal neurofibromatosis as the only localization of von Recklinghausen's disease is comparatively rare. The patient was a man in whom in the course of the first laparotomy a tumor and 20 cm. of the small intestine were removed. Several years later the presence of numerous nodules on the small and large intestine made removal of all of them impossible, but three pedicled tumors on the descending colon were extirpated, and microscopic examination disclosed that they were neurofibromas.

Subthreshold Myocardial Lesions D. K. Spang.—p. 56.
*Effect of Strophanthin on Coronary Blood Perfusion Considered in Connection with Sensory Manifestations in Heart Region. W. Schmidt.—p. 58.

Hemorrhagic Reactions in Typhoid After Prophylactic Immunization.—The recent typhoid epidemic in Berlin gave Rossle an opportunity to observe the effect of prophylactic vaccination against it. His aim was to determine whether the subcutaneous introduction of killed bacilli exerts any influence on the character, course and outcome of typhoid. A characteristic aspect of those who had been vaccinated was the appearance of hemorrhages at the sites of the typhoid process in intestine, mesentery, spleen and the typhoid granulomas of the liver or at sites of nonspecific sensitization such as the intestinal wall or cerebral meninges. The fatal hemorrhages in patients in whom vaccination against typhoid was performed when the patient was already in the incubation period or typhus was just becoming manifest were especially noteworthy. The author regards them as manifestations of a rapidly occurring change in the endothelial reactions at the sites in question and thinks that they belong to the large group of partially nonspecific pathergias. They are not merely a summation of toxic effects from the endotoxins of the infection with those of the vaccine. The important question of how long before and after infection vaccination against typhoid can be regarded as dangerous remains unsolved.

Action of Strophanthin on Coronary Blood Perfusion.—Schmidt found that some patients complain of a sensation of oppression in the heart region following injection of strophanthin. He found that strophanthin produces in many cases reduction in coronary blood perfusion but that this reduction is reversible and is generally followed by increased coronary blood perfusion. The temporary decrease in coronary blood perfusion is due to changed energy conditions in the myocardium and to increased irritability of the sympathetic nervous system, particularly of the vagus. The sensory manifestations in the heart region following the injection of strophanthin are sequels of changes in the energy exchange in the myocardium and of its effect on the vagus. The increased coronary blood perfusion usually subsides in from thirty to forty-five minutes. The G and K strophanthins have identical effects on coronary blood perfusion.

Book Notices

Techniques and Procedures of Anesthesia. By John Adriani, M.D., Director, Department of Anesthesia, Charity Hospital of Louisiana, New Orleans. Fabrikoid. Price, $6. Pp. 401, with illustrations. Charles C Thomas, 301-327 E. Lawrence Ave., Springfield, Ill., 1947.

This is the third book on anesthesia published by Dr. Adriani. "The Pharmacology of Anesthetic Drugs" (1941) is, as stated in the preface, "an outline limited to fundamentals." "The Chemistry of Anesthesia" (1946) is a consideration in three parts, written in the usual narrative style, of the inorganic and the organic chemistry of drugs used by the anesthetist, the third part being devoted to a discussion of changes in biochemistry accompanying anesthesia.

The present volume, on technics and procedures, reverts to the style of the author's first volume. Again, in the words of the preface, "an attempt has been made in this outline not only to enumerate the technical details of anesthesia but the associated reasons for executing them in the manner described." To avoid disappointment, the prospective purchaser must realize that the book is just that: an outline which enumerates only. Nearly all the various types of anesthesia used in modern practice are covered. Methods of mitigating undesirable effects of each are enumerated. Thirty-six pages are devoted to artificial respiration and inhalational therapy.

The outline style leads to unavoidable dogmatism, and the book thus represents the author's views. In general, however, these are views which are rather widely accepted at this time. It may be doubtful whether such a book is acceptable as a teaching manual for graduate students. As a quick work of reference for undergraduates or technicians its appeal may be greater. The index is adequate. Numerous well placed simple diagrams and photographs clarify the brief outlines of many subjects. The volume is valuable as a quick means of referring to the opinion and practice of the author. Used after mastery of his other two volumes, this book will be found quite adequate by the student. It must be realized that the methods set forth are those of the author, which are in use at Charity Hospital, New Orleans, in 1947.

The Anatomy of the Nervous System: Its Development and Function. By Stephen Walter Ranson, M.D., Ph.D. Revised by Sam Lillard Clark, M.D., Ph.D., Professor of Anatomy, The Vanderbilt University School of Medicine, Nashville. Eighth edition. Cloth. Price, $6.50. Pp. 532, with 417 illustrations. W. B. Saunders Co, W. Washington Square, Philadelphia 5, 1947.

This has been the leading textbook in its field since it first appeared in 1920. An epoch in neurologic teaching and research began at about that time, and the late Professor Stephen Walter Ranson played a leading part in its development. His influence has been felt throughout the country, not only in the more limited sphere of the nervous system, but in all aspects of anatomy, which he so ably helped build into a highy functional and meaningful subject for the student of medicine. During his lifetime he contributed six revisions on this book, earnestly striving to incorporate significant advances and at the same time avoid emphasis of insignificant details. It is remarkable that even after he had ceased to instruct first year students and had become engrossed in highly technical aspects of research, he was able to keep the beginner's point of view in his writing.

It is with universal approval that those who knew Professor Ranson learned that one of his students and colleagues, Professor Sam L. Clark, had agreed to assume the task of further revisions of the Anatomy of the Nervous System. The eighth edition should please all who were devoted to previous ones, for it has maintained the good characteristics while incorporating worth while reorganization and additions.

One of the principal changes in this edition is the shift of consideration of the gross anatomy and of the meninges and blood vessels of the central nervous system to the forward part of the book. From a pedagogic point of view this is a change of considerable value. Consideration of histogenesis of neurons, of neuroglia and of the peripheral nervous system follows this and precedes the detailed structure and function of intrinsic spinal cord and brain structures. Numerous minor changes have been made throughout these chapters of the text, and new illustrations have been added.

One of the important parts of the book is the atlas of brain sections and the accompanying descriptions. This has been improved by addition of a series of parasagittal sections through the brain stem. This part of the book adds a great deal to its value for the student who is learning neuroanatomy, but it is likewise useful to any one who wishes to use the book for reference. There is no doubt that the volume will continue to meet with favor among the members of the medical profession.

Elsevier's Encyclopædia of Organic Chemistry (in 20 Volumes). Edited by E. Josephy and F. Radt. Volume 14: Tetracyclic and Higher-Cyclic Compounds. Series III: Carboisocyclic Condensed Compounds. 1940. Cloth. Subscription Price, $15; Serial Price, $52.50; Single Volume Price, $60. Pp. 711. Elsevier Publishing Co., Inc., 215 Fourth Ave., New York 3, [1946].

The proposed set of twenty volumes represents an attempt to produce a "standard work in English to give complete information on all chemical and physical properties and on the most important physiological properties of organic compounds."

Volume 14, the first of the projected series to appear, covers the tetracyclic and higher-cyclic compounds of organic chemistry, including sterols and triterpenes. Completed in 1940, it was delayed because of the war. This unfortunately aggravates, in the present case, a defect that is inevitable in large works of this sort. They can never be very up to date, and in the present volume only the literature through 1936 is thoroughly covered with the exception of a few late references. Since these volumes are scheduled to appear at intervals of about six months, it is hoped that future volumes will carry more up to date reference lists.

Sufficient emphasis has been placed on the physiologic and biologic actions of the compounds listed to warrant its use by other than chemists to whom the series will be of primary interest. Pharmacologists, especially, will find inspiration in such pages as 413 and 494, where the interesting possibilities in higher-cyclic compounds are suggested by collections of skeleton formulas. They indicate that it will be a long time before research workers exhaust the therapeutic possibilities of organic chemistry.

Like the "Organische Chemie" of Beilstein, these volumes are to be divided into three sections corresponding to the aliphatic, carbocyclic and heterocyclic series of organic compounds. From this division a systematized plan of presentation is followed. No new systems of nomenclature are to be used. Each volume is to have a subject and a formula index. The indexes are to contain, besides the individual compounds, lists of compounds similar in structure or function, e. g., compounds with triple bonds, carcinogens and hormones.

In this, the first, volume to appear are included data on many carcinogenic agents, sex hormones, naturally occurring compounds, vitamins and provitamins, cardiac glycosides, bile acids and others which fall in this particular organic classification. Besides a table of contents for each ring system, data are included on occurrence, formation, preparation, reactions, detection, physical and chemical properties, derivatives, reaction schemes with many structural formulas, and literature, subject and formula indexes.

The volume contains a huge fund of information and along with the rest of the series is probably destined to become a primary source of information. English scientific literature needs such an encyclopedia.

Principles and Practice of Obstetrics. By Joseph B. De Lee, M.D., and J. P. Greenhill, M.D., Attending Obstetrician and Gynecologist, the Michael Reese Hospital, Chicago. Ninth edition. Cloth. Price, $10. Pp. 1,011, with 860 illustrations. W. B. Saunders Co., W. Washington Square, Philadelphia 5, 1947.

De Lee's Obstetrics, as it has been referred to so long and so warmly, appears again in its ninth edition under the skilful direction of J. P. Greenhill. It is true that this book was recognized as a classic during De Lee's lifetime when he was the sole author. The fact that it goes on under the momentum of his authorship, still acclaimed, indicates its stature more clearly than ever before.

Greenhill has made many well chosen additions, and necessary changes in accordance with current obstetric advances. Since he assumed direction of the revisions of this book his choice of subjects to keep the book closely up to date has been an especially noteworthy feature. In the eighth and this ninth edition, the book has been largely rewritten, but nothing of De Lee's fluid and easily understandable style has been lost. One innovation in format, questioned at first, is the double column on each page. In a book as large as this one has always been, the double column setting seems to make easier reading when one becomes accustomed to it. The paper is excellent, the printing clear and even, and the binding well done.

Several new chapters have been added, and old ones have invariably been changed to add accepted new findings or procedures. Analgesics and anesthetics in labor and delivery are an example. The subject of blood transfusions during labor could perhaps be amplified to advantage. The modern treatment of puerperal infection with sulfonamides and penicillin is thoroughly described and directed. Some illustrations have been added, although these were scarcely needed, as the book has always been noted for its profusion of splendid pictures. Greenhill adheres to De Lee's preference for mediolateral episiotomy, but for those who utilize the median incision a limited set of illustrations of the latter would be helpful for practice and for teaching.

One of the many features should be referred to, simple as it is. The index includes one important teaching item usually not found in an index. In addition to a careful indexing of textual subject matter, the illustrations are also tabulated by subjects. For quick reference and to distinguish these, the page numbers are set in different type, bold face for text, italics for illustrations. The book is to be strongly commended to all who have any interest in obstetrics, to students, to practitioners and to specialists without distinction.

Russian-English Technical and Chemical Dictionary. [Compiled] by Ludmilla Ignatiev Callaham. Fabrikoid. Price, $10. Pp. 794. John Wiley & Sons, Inc., 440 4th Ave., New York 16; Chapman & Hall, Ltd., 37-39 Essex St., Strand, London, W. C. 2, 1947.

Compilation of this dictionary was begun to prepare "a convenient reference for chemists and chemical engineers in both the chemical and process industries." This was certainly achieved successfully. However, since no one field of science or technology is sufficient unto itself and enclosed within rigid ines of demarcation—rather, the boundary lines between it and other fields from which it of necessity borrows and with which it collaborates are blurred and indefinite—the inclusion of terms in this work was broadened to give a quite comprehensive coverage of many related fields, such as pharmacy and botany. It is to be hoped that the dictionary will be expanded in the future, preferably to include more purely scientific terms, those of value, for instance, to readers of medical and biologic literature.

The author points out a fact that will be conceded by any one who has dealt with foreign languages, namely that it is necessary to have at least an elementary knowledge of Russian to use the dictionary. For instance, to be specific, an English speaking person without knowledge of Russian would encounter difficulty in looking up nouns and verbs; the former, of course, frequently occur in the Russian text in other than the nominative case in which they are given in the dictionary, and the latter in another form than the infinitive which appears in the dictionary.

The preface of the book is helpful in that it explains such points as handling translation of "Russianized" words, with examples. A Russian alphabet with transliteration, a table of common Russian technical word endings and a list of the reference sources on which the dictionary is based are carried at the front of the book.

The Head, Neck, and Trunk: Muscles and Motor Points. By Daniel P. Quiring, Ph.D., Head of the Anatomy Division, Cleveland Clinic Foundation and Associate Professor of Biology, Western Reserve University, Cleveland. Fabrikoid. Price, $2.75. Pp. 115, with 103 illustrations. Lea & Febiger, 600 S. Washington Square, Philadelphia 6, 1947.

This book is a companion volume to the author's "The Extremities." Its purpose is to portray in diagrams and condensed descriptions the striated muscles of the head, neck and trunk. It offers an exact account of the skeletal attachments, nerve and chief arterial supply, and functions of these muscles. The diagrams are based on original dissections and on references to the anatomic literature. The presentation has the advantage of clarity. Each muscle is shown in a single diagram together with its concise description. It is a fine example of limiting the nonessentials. It permits a rapid survey of skeletal-muscular anatomy. The line drawings are excellent. The general motor points of the face are shown in a single illustration. As a quick and handy guide it will undoubtedly find considerable usefulness. Medical students particularly will find this work helpful for review purposes. It should be valuable to students and to physical therapists. Surgeons will find it a useful reference work. Physical education departments in colleges and universities offer courses in human anatomy sometimes with actual dissections. This book is suited to such a course.

Tumores y seudotumores de la mama: Estudio de investigación experimental, su profilaxis y tratamiento. Por el Dr. Jacinto Moreno. Paper. Pp. 142, with 40 illustrations. Lopez & Etchegoyen, S. R. L., Junin 863, Buenos Aires, 1946.

This rather detailed monograph on tumors of the breast is well presented, is profusely illustrated and reveals a studious understanding of the subject matter. Although some of the ideas presented are at variance with the concepts generally accepted in this country, the rationale of the conclusions reached by the author is of interest. His classification of breast tumors discussed is relatively simple and avoids the complexities of some classifications. His discussion of the hormonal influence in the development of cancer is concise and to the point. It agrees in the main with the concepts of Novak and Geschickter and others. The author is emphatic in his statement that, based on his observations, all malignant breast tumors metastasize within two years, irrespective of the type of therapy used. This, of course, will not be universally accepted. He condemns breast amputations in suspected lesions, such as the mastitides, or as a prophylactic measure in questionable cases. A complete and exhaustive study of the patient prior to surgical intervention will frequently reveal, he states, coexistence of tumorous growths elsewhere in the body; if so, surgery is definitely contraindicated. The author concludes that all patients with cancerous growths of the breast show some type of endocrinopathy with abnormal metabolic changes; the endocrine deficiency is related to the sex organs; the patients show hyperglycemia, increased blood phosphorus and decreased blood calcium contents. The monograph fails to include any statistical studies to corroborate these findings, nor are any biochemical studies reported to confirm the author's statements.

Your Rheumatism and Backaches. By Joseph D. Wassersug, M.D. Cloth. Price, $2.50. Pp. 310. Wilfred Funk, Inc., 227 E. 44th St., New York 17, 1947.

Dr. Wassersug presents in this handy volume excerpts from a limited store of contributions. The book contains numerous case reports culled from the literature, and some controversial aspects of the problem are presented. Many a senior medical student could gather twenty or more articles and write a similar book in his own room without seeing one case of arthritis.

Diseases of the Nose and Throat. By Charles J. Imperatori, M.D., F.A.C.S., Consulting Laryngologist, Harlem Hospital, and Herman J. Burman, M.D., F.A.C.S., Director of Department of Otolaryngology, Harlem Hospital, New York. Third edition. Fabrikoid. Price, $12. Pp. 576, with 480 illustrations. J. B. Lippincott Co., 227 S. Sixth St., Philadelphia 5, 1947.

In this edition the authors have somewhat altered their format, utilizing the popular two column style. One is impressed by an attempt to present in terse, almost outline, form the numerous diseases associated with the nose, throat and larynx. Certain chapters, such as those on roentgenology and laboratory procedures, have been presented by competent collaborators. There are a number of specific objections which could constructively be stated about the book. For the undergraduate much of the material does not fit into his needs, and for the postgraduate in rhinolaryngology it is not complete enough. While it is clear that some sections of the book may be of value to the trained specialist, it will take other editions to allow the authors to bring more uniformity into the work generally and to amplify areas that have been too briefly stated for a purposive study. Attempts at specific review of subjects where brevity is the keynote is admirable but not always practical. Pictorial material in the book could be greatly enhanced and its therapeutic content sifted in the light of modern concepts.

Queries and Minor Notes

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards will not be noticed. Every letter must contain the writer's name and address, but these will be omitted on request.

FOOT BATHS IN LOCKER ROOMS

To the Editor:—What is the present consensus with regard to the value of foot baths in locker rooms, swimming pools and gymnasiums for preventing the spread of ringworm? A few years ago sodium hypochlorite solution was recommended; is this still considered of value? Also there are commercial solutions on the market. Is there much chance of skin irritation from any of these foot bath solutions?

M.D., Illinois.

Answer.—There is much less use of antiseptic foot baths in locker rooms, swimming pools, and similar places in attempting to prevent ringworm of the feet now than formerly. Sodium thiosulfate 10 per cent is much less used. Sodium hypochlorite 1 per cent seems to have more adherents, but the solution should be changed probably every forty-eight hours. Little skin irritation has been seen from any of these foot bath solutions. A study of dermatophytosis in industry by the U. S. Public Health Service showed that there was no value to foot baths and copper impregnated flooring in preventing the spread of tinea pedis. The National Research Council in 1944 recommended that foot baths for the prevention of tinea pedis should not be used by our armed forces.

In a paper read before a Congress on Industrial Health, Schwartz recommended the use of individual wooden sole bathing slippers to be worn in and out of shower baths and the thorough drying of the feet, especially the interdigital spaces, as the logical method of preventing the spread of tinea pedis in locker rooms and shower baths. If commercial solutions on the market for use in foot baths are of sufficient concentration to kill fungi on the feet in the short time that the feet are immersed or sprayed by them, they are likely sources of skin irritation.

DERMATITIS FROM ENDOCRINE PREPARATION

To the Editor:—A woman was given for menopausal symptoms a pink liquid smelling like paregoric that acted physiologically like the hormones of pregnant mare's urine. She developed a red, dry, scaling dermatitis of the face. Can the medicine be the cause of the dermatitis?

M.D., Pennsylvania.

Answer.—The preparation which was administered in the form of a pink liquid would probably be an elixir containing extracts of the urine of pregnant mares containing the fractions with estrogenic activity. Such extracts contain a number of estrogenic substances, although the chief activity is due to estrone, with some effect contributed by the weakly estrogenic steroids such as beta estradiol, equilin and hippulin. There is little evidence available which would indicate that human beings are sensitive to these steroid compounds, especially when taken by mouth. It is barely possible that the patient reacted to the medication by increased nervousness and tension, a not uncommon reaction following the administration of rapidly absorbed estrogens. If this occurred it is possible that the rash might be considered of neurogenic origin. In view of the relative impurity of these extracts, however, the patient could have been allergic to one of the contaminants in the preparation. The administration of a purer oral estrogen is advised to gain a better understanding of the patient's response.

EARLY GLAUCOMA

To the Editor:—Will you please tell me the early symptoms of glaucoma? I should like to know more about how to diagnose glaucoma and the latest treatment.

M.D., Oklahoma

Answer.—Chronic simple glaucoma manifests itself earliest in an enlargement of the blind spot, as shown by a test of the central fields. Usually serious loss of the vision of one eye has occurred before the patient knows of any trouble at all. The tonometer is necessary to determine the exact tension of the eye. Low tensions can many times be controlled by pilocarpine; physostigmine is needed in more severe cases; doryl is a newer drug which is effective in many cases. As soon as the central fields begin to get worse, operation (trephining, cyclodialysis, iridodenclesis) must be resorted to and are quite uniformly successful.

BISMUTH SALTS IN TREATMENT OF RHEUMATOID ARTHRITIS

To the Editor:—I have read with interest the several reports published in the last several years concerning the use of aqueous bismuth solutions intravenously for the treatment of undulant fever and follicular tonsillitis, reference being made to its safe use therein. Also a report using 0.5 cc. intramuscularly at monthly intervals for arthritis. Would it be logical to assume that the action of bismuth intravenously is any different from its use intramuscularly? Are there any reports pertaining to the use of bismuth intravenously or intramuscularly in the therapy of rheumatoid arthritis, using the bismuth compound in place of gold salts?

Clifford W. Atherton, M.D., Fairview, Ill.

Answer.—In an effort to find an equally effective, less toxic preparation than gold salts in the treatment of rheumatoid arthritis, Tarsy (1941) used colloidal bismuth, also colloidal platinum and selenium. Injections of these colloids into a few patients "gave insufficient promise of therapeutic usefulness" and were therefore not continued. Colloidal gold was more effective.

Also as a possible substitute for gold salts Douthwaite (1944) independently used intramuscular injections of bismuth salicylate (200 mg. doses repeated weekly for ten weeks). Toxic reactions did not occur. Of 12 patients with rheumatoid arthritis so treated significant improvement resulted in 6. It was concluded that bismuth salts were less toxic and less effective than gold salts. Relapses occurred more quickly than with gold salts. Gold resistant arthritis was considered unlikely to benefit from bismuth. Bismuth was "indicated only for rheumatoid arthritic patients who show intolerance, whether physical or mental, to gold."

Because injections of sodium bismuth tartrate (a water soluble salt of bismuth) appeared to relieve yaws with its "rheumatic-like" manifestations, Hall (1944) used such injections for a variety of conditions, chiefly rheumatoid arthritis but also for osteoarthritis, "arthritis deformans" and even Paget's disease. Injections were given intramuscularly (generally intragluteally) every four to eight weeks for a variable number of doses (totaling not more than 12 grains [0.78 Gm.]) each dose being ½ to 1 grain (0.032 to 0.065 Gm.). Serious toxic results were not noted. The diagnostic terminology used was not clear, and the illustrative case reports were so brief as to be of little value. Statistical results were not given. Hall merely stated that "improvement of varying degrees should be expected in at least 60 per cent of cases."

In a second report published a year later (1945) Hall again recommended this treatment, chiefly for rheumatoid arthritis, in small doses (½ grain) given by intramuscular injection every four to six weeks for a total of six injections. No serious toxic effects were noted as a result of "thousands of doses, but overdosage sometimes produced exacerbations of articular symptoms. Again no statistical or clinical proof was offered to support the author's impressions as to the effectiveness of this treatment. Although toxic reactions from these doses were not reported, bismuth, being a heavy metal, may and sometimes does produce toxic reactions in syphilitic patients so treated. "Pharmaceutic arthralgia", or articular pains with swelling ("paratherapeutic arthritis") may occur (Hollström). In about 10 per cent of one group of syphilitic patients "bismuth hepatitis" developed; it was generally transient and nonfatal but occasionally fatal (Kulchar and Reynolds). Stomatitis, pharyngitis, fever, leukocytosis and albuminuria may occur from overdosage (Seifter and McDonald).

Intramuscular injections are considered less toxic than intravenous injections of bismuth which result in the rapid absorption of relatively large amounts. Water soluble compounds are more toxic than colloidal compounds.

In conclusion it remains to be shown that preparations of bismuth are of value in the treatment of rheumatoid arthritis.

PERIARTERITIS AND MIGRATING THROMBOPHLEBITIS

To the Editor:—1. Why are the veins not involved in diffuse vascular disease such as periarteritis nodosa? 2. What are the etiologic factors behind recurrent migrating superficial thrombophlebitis involving at various times the upper and the lower extremities and axillas, thromboangiitis obliterans, fungous infection and trauma being ruled out.

Roy J. Popkin, M.D., Los Angeles.

Answer.—1. The etiology of periarteritis is unknown. Rich reported that the arterial lesions of periarteritis nodosa may be dependent on increased sensitivity of tissue to foreign substances. He reported a series of cases of serum sickness and reactions to sulfathiazole in which the lesions of periarteritis nodosa were found. Rich and Gregory sensitized animals to horse serum and a few days later injected horse serum; widespread lesions of periarteritis nodosa developed. They concluded that "periarteritis nodosa is a manifestation of anaphylactic hypersensitivity, and widely different sensitizing antigens can be responsible for the development of vascular lesions in patients." Veins are injured rarely in periarteritis nodosa, but this may occur. There is no explanation for this situation.

2. Migratory superficial thrombophlebitis may be a manifestation of thromboangiitis obliterans or of cancer chiefly of the lung, pancreas and stomach and may occur in polycythemia. Occasionally rather minor degrees of trauma may cause venous thrombosis. The role of fungous infections is uncertain. In some instances careful study indicates an increased tendency of the blood to coagulate. Thromboplebitis of course occurs commonly in varices. In many instances recurrent phlebitis is not secondary to any detectable cause but is a disease in itself known as idiopathic recurrent thrombophlebitis.

CHEMOPROPHYLAXIS FOR TONSILLECTOMIES AND EXTRACTIONS

To the Editor:—A discussion has been developing in local medical circles as to the value of the use of penicillin during tonsillectomy in cases of rheumatic polyarthritis and endocarditis as a preventive measure against new exacerbations of the quiescent disease. My own experience is still scanty and I still miss the extensive American and British literature about the different aspects and possibilities of penicillin therapy.

F. Dobihal, M.D., Prague, Czechoslovakia.

Answer.—It is generally agreed that chemoprophylaxis is indicated for any person who has had rheumatic fever, particularly for one who has a residual endocardial lesion and who is to have oral surgery such as a tonsillectomy or extraction of teeth. A transient bacteremia following such procedures might well precipitate an attack of rheumatic fever or result in the establishment of bacterial endocarditis. The sulfonamides have been employed for this purpose as well as penicillin. Up until recently the limited supplies of penicillin have been devoted to the treatment of established infections rather than for prophylactic purposes, although penicillin was utilized prophylactically in the management of war wounds. It is suggested that one to two hours prior to tonsillectomy 300,000 units of penicillin in a beeswax-peanut oil preparation should be injected intramuscularly. This amount may then be given every twenty-four hours after tonsillectomy for one or two days. These amounts should provide adequate levels in the serum. The sodium salt of penicillin may be dissolved in sterile saline solution and given intramuscularly at more frequent intervals, if desired.

GROWTH AND DEVELOPMENT OF INFANTS

To the Editor:—Could you kindly give me references on the long term follow-up on growth and development of three groups of infants, those who (a) exhibit neonatal erythroblastosis, (b) suffer severe neonatal cyanosis, (c) are premature.

Elizabeth Kirk Rose, M.D., Philadelphia.

Answer.—(*a*) References as to long term growth and development of infants who exhibit neonatal erythroblastosis are: Zimmerman, H. M., and Yannet, Herman: Kernikterus, *Am. J. Dis. Child.* **45:**740 (April) 1933. This report deals only with one phase of the residua of this condition. Recently published is a book (Rh: Its Relation to Congenital Hemolytic Disease and to Intragroup Transfusion Reaction, by Edith L. Potter, Chicago, Year Book Publishing Company, 1947) which contains some follow-up information on this condition.

(*b*) In infants who suffer neonatal cyanosis the question is difficult because cyanosis is but a symptom in various conditions and diseases. In the older literature "asphyxia livida" was the term used to denote cyanosis at birth and was divided into intrauterine and extrauterine causes. Norman W. Clein (Premature Infants, *Am. J. Dis. Child.* **37:**751 [April] 1929) studied cyanosis in premature infants in the early neonatal period. Among the causes of newborn cyanosis one might mention congenital heart disease, atelectasis of the newborn, intracranial hemorrhage, aspiration pneumonia and a variety of other conditions which might have to do with the failure of circulation or blocking of air passages. References on follow-up of infants exhibiting neonatal cyanosis would therefore depend on the exciting cause.

(*c*) One of the best references on follow-up on growth and development of premature infants can be found in The Physical and Mental Growth of Prematurely Born Children, by Julius H. Hess, George J. Mohr and Phyllis F. Bartelme, University of Chicago Press, 1934.

GILT USED IN PRINTING TRADES

To the Editor:—What pulmonary and systemic symptoms and pathologic change might be expected in those who work in an environment in which the air is continually saturated with particles of gilt used on the labels of alcoholic beverages?

M.D., Maryland.

Answer.—Gilt powders as used in printing ordinarily contain finely divided particles of brass or bronze, hammered out from small ingots of such metals. Some brasses and bronzes contain appreciable quantities of lead by design or as an impurity. As a rule, brass or bronze later pulverized is essentially lead free. Lead poisoning from this source is an unlikely hazard. Otherwise this dust in the atmosphere is to be regarded merely as a nuisance and high atmospheric contamination is well tolerated. Nothing analogous to silicosis will develop, although after prolonged, extensive exposure a mild condition discernible in the chest x-ray film may appear to which the term "benign pneumonoconiosis" is applicable. Likewise gross exposure may lead to minor irritation along the respiratory tract on a mechanical basis. In this type of printing operation the area to be covered by gilt may first be printed with glue. The constituents of this glue are not constant. It is possible that sensitization to the glue rather than to the gilt may arise, so that asthma or other indication of an allergic state may be in evidence. Such a state has arisen from gum arabic as applied in printing operations. The upper limit of tolerance for nuisance dusts approximates 50 million particles per cubic foot of air. Any excess over this level should be controlled by appropriate exhaust systems.

HIRSUTISM

To the Editor:—I have heard indirectly that areas of hirsutism can be successfully treated by the local application of an ointment containing, I think, testosterone propionate. Kindly discuss the local application of hormone preparations to areas of hirsutism. Please give references in the literature.

M.D., Colorado.

Answer.—Any patient with hirsutism should have endocrinologic studies to rule out organic pathologic conditions such as Cushing's disease, arrhenoblastomas and the adrenogenital syndrome. If negative, the generally preferred method of permanent removal of superfluous hairs is by electrolysis. It has been reported in the literature that as little as 450 mg. of testosterone propionate has produced hirsutism.

HEXAETHYL TETRAPHOSPHATE

To the Editor:—Concerning the question in Queries and Minor Notes for June 21, 1947 regarding the toxic effects to be expected in man from the insecticide hexaethyl tetraphosphate: It should be emphasized that if the oral toxicity figures in animals are transferable to man, as little as 0.35 cc. (about 5 drops) may be fatal if ingested. Hexaethyl tetraphosphate is a very potent anticholinesterase agent (such as physostigmine, neostigmine and di-isopropylfluorophosphate) and this fact allows certain toxic effects in man to be anticipated although severe poisoning has not been reported. Miosis, feeling of constriction in the chest, increased gastrointestinal and salivary activity, headache and skeletal muscle twitching may be expected. A conspicuous symptom of severe poisoning in certain experimental animals, as observed in this laboratory, is dyspnea with extreme cyanosis (bronchospasm?) controllable by atropine when given prophylactically or early in the course of poisoning. Though the studies are incomplete, it appears that the use of atropine and other parasympathetic depressants and sympathomimetic and other bronchodilator drugs in suitable doses and at proper intervals should provide the rational basis for the drug therapy of acute hexaethyl tetraphosphate poisoning. Artificial respiration should be promptly instituted if such drug therapy fails.

THE CHALLENGE OF FUNCTIONAL DISEASE

Chairman's Address

JOSEPH T. WEARN, M.D.
Cleveland

More than one half of all the hospital beds in this country are occupied by patients who are mentally ill; more than one fourth of the annual operating budget of New York state is now devoted to caring for the mentally ill; of some 15,000,000 men examined by Selective Service, 1,875,000 were rejected on the ground of neuropsychiatric disorders. This represents 37 per cent of the men rejected for all causes; and even after this initial screening, 39 per cent of all medical discharges from the army between January 1942 and December 1945 were classified as psychoneuroses.[1] At least 5 of every 10 patients who consult physicians today prove through examination to have no organic basis for their complaints. A small, highly specialized group of psychiatrists, working independently, have attempted to cope with this problem, but this group is so small and the problem is so great that it is physically impossible for them to carry more than a fraction of the load. Therefore, unless all practitioners assume the responsibility the greater part of this work will not be done.

In view of the exceedingly serious import of these facts, each individual physician must ask himself if there is any responsibility on him and, if so, how adequately is he prepared to meet this problem? The practitioner, whether he desires to or not, certainly must shoulder the responsibility for the simple reason that, be he pediatrician, internist, surgeon or general practitioner, he is the first to see these patients and may see them when the emotional disturbances are in the incipient stage. The pediatrician, for instance, who follows the child from infancy to adolescence, is in a peculiarly strategic position to recognize the earliest disturbances and to take steps to correct them through skilled and intelligent guidance of the parents. This is of great potential importance, for it is generally believed that the bases for psychoneuroses that develop later are formed in infancy and childhood. Probably there is no place where more effective preventive work can be done than in early childhood. The importance of recognizing, evaluating and properly treating the emotional disturbances in young children or, still better, of creating an environment in which such disturbances are prevented cannot be overemphasized, for the way in which these factors are handled will "make" for harmony or disharmony in the development of the human personality."[2] It follows that the general practitioner, who in many communities serves not only as the pediatrician but also as the principal adviser on family problems, has the same great opportunity and responsibility.

Later in the patient's life it becomes the responsibility of the internist and family physician to recognize the manifestations of emotional disturbances and to evaluate emotional as well as physical symptoms. The surgeons too, including orthopedists and gynecologists, have a duty to recognize functional disease in patients seeking surgical care and to take note of the emotional disturbances evoked by their procedures. There can be no doubt that many a woman with a functional backache has endured an orthopedic brace or been subjected to a hysterectomy and still ends up with the backache unrelieved. In short, it is only too evident that all physicians have a continuing and very real responsibility for the identification and correct management of patients with functional disorders.

If this is true it must then be asked how well qualified is the average physician to undertake this work and what has been his training for it? A partial answer to this question may be found by glancing at the curriculums of the medical schools and teaching clinics of this country during the past fifty years. It is generally known that medical schools have concentrated on the many problems of organic disease. The reasons for this seem obvious. In the first place, it is the organic diseases that kill; the great epidemics have taken a toll of millions through the years. One need only mention some of those that have occurred during the last half century, such as typhoid, typhus, smallpox, malaria and influenza. Other diseases, including the cardiovascular group, malignant growths and malnutrition, have been equally deadly. It was inevitable, therefore, that the energies of physicians both in research and in practice were mobilized to solve the problems presented by these lethal diseases. These same men as teachers in the medical schools focused their attention on training students in the cause and treatment of organic disease. The researches carried on through these years also naturally followed this same trend and were amazingly productive and brilliant—many of the infectious diseases having been largely eliminated. With the aid of new biochemical, physiologic and immunologic techniques enormous strides have been made in the diagnosis, prevention and treatment of these organic diseases, and the pace has not been slackened.

This emphasis on organic disease still persists today in medical schools for the reasons mentioned and also, perhaps, because it is much easier to give a lecture to third year students on factors which cause disintegration of bacteria than on those which cause disintegration of

[2] Putnam, M. C.: Second Annual Report, The Children's Center, Roxbury, Mass.

personalities. Until comparatively recent years little formal training was offered to the student in the diagnosis and treatment of functional disease. It is not surprising, therefore, that the average practitioner, through no fault of his own, has not had adequate training in the care of functional disease and is aware of a lack of proper qualification to deal with it. There are exceptional practitioners, versed in the art of medicine, who have had unusual success in this field, but many others fail to recognize it or refuse to admit its existence. When they find no evidence of pathologic or structural lesions to account for a patient's complaints, they are too ready to tell him that there is nothing wrong because all tests are normal and to advise him to take a vacation and forget his troubles. There are exceedingly few physicians, including those in the specialties other than psychiatry, who are really familiar with the tenets, technics and therapeutic methods of modern psychiatry.

The brilliant achievements of medical science in the field of organic disease during the past fifty years have blinded many physicians to the fact that the psychiatrists, too, have made significant advances both in the understanding of the mechanisms of the human emotions and in the evolution of new technics and methods of treatment. At the beginning of this century, Kraepelin published his descriptions and classifications of the various syndromes of mental disease, and hospitals for the care and study of advanced psychoses began to appear. It was the first World War, however, that created the increased demand for psychotherapy. Further advances were made both in Europe and in America, notably in the clinics of Salman, Southard and Meyer in this country. During these years Freud was conducting his epochal studies of the factors governing the unconscious workings of the mind, which subsequently led to psychoanalysis as a technic for the relief of psychic distress. This is not the place to go into the details of his many original theories and technics, but his orderly method of eliciting and evaluating significant data from the emotional life of a patient points a value for the practitioner of medicine which he cannot afford to ignore.

Even at the beginning of the second World War the magnitude of the psychiatric problem was grossly misjudged, for although an attempt was made to have every man entering the armed forces screened by a psychiatrist, the time allotted for this was absurdly inadequate and the number of skilled psychiatrists extremely small. Further evidence of miscalculation was the fact that the table of organization for a thousand bed general hospital called for but one psychiatrist. On reaching the field these hospitals were swamped with neuropsychiatric patients and were forced to draft a considerable proportion of their internists for the psychiatric services. As the war progressed, the deficiency of facilities for the care of these patients became more and more apparent, as did the realization that the number of available psychiatrists was wofully inadequate. In the face of their overwhelming burden the psychiatrists in the field performed magnificently and developed new and more successful methods of treatment. During the war many medical men in the services recognized the need for the effective handling of emotional problems and saw for the first time some of the results of psychiatric technics and treatment.

Why then, in the light of these obvious needs, these achievements by psychiatry and these wartime opportunities for practitioners to see the effects of emotions on body functions, has there not been a closer integration of psychiatry with the rest of medical practice? For one thing, there can be little doubt that there still persists a certain amount of mutual hostility and suspicion between the two groups. Many practitioners tend to believe that the psychiatrist either overlooks entirely or minimizes unduly the somatic origin and significance of structural lesions. For example, physicians are not favorably impressed by psychiatrists' claims that asthma, arthritis, peptic ulcer and even tuberculosis may be of emotional origin. Some physicians believe that if psychiatrists were better grounded in organic medicine many of their claims would be less sweeping and, therefore, more susceptible of scientific proof. The psychiatrist, on the other hand, believes that the practitioner fails to look at the human being as a whole, disregards the actions and reactions of the patient and concentrates on clinical procedures and laboratory measurements while treating disease as an accidental pathologic invasion unrelated to the particular character of the host. In short, the psychiatrist seems to believe that the medical practitioner is engaged in a relatively unimportant series of quantitative analyses, while wholly missing the deeper, or psychiatric, significance of most disease. Again, the physician finds many of the hypotheses and postulates of the psychiatrists fantastic and in some instances actually absurd. Also, experienced practitioners rather resent the claims of some psychiatrists that psychiatrists alone are qualified to teach the art of medicine, despite their limited knowledge of the general field of medicine and their lack of experience in it.

The psychiatrist loudly proclaims that his hypotheses are highly scientific, that they are based on a body of scientific data and that psychoanalysis is a standardized scientific discipline. The medical scientist trained in the disciplines of biochemistry and biophysics fails to find precise measurements in this body of data. This has been admirably expressed by Gregg[3] in his Critique of Psychiatry: "For example, a valuable addition to the ranks of psychiatry would be some recruits whose training and formation of mind in the more exact sciences would operate in the direction of insisting on more precision, a search for measurable phenomena, more emphasis upon phenomenon and less upon noumenon, and more discrimination in the examination of evidence."

Again, some psychiatrists seem satisfied with the long term method of treatment which considers the whole life of the patient as in psychoanalysis, whereas the medical practitioner is in constant search for the swiftest means of restoring health. The present trials of penicillin instead of the older methods of treatment for gonorrhea, syphilis and pneumonia are examples. Without any thought of passing judgment on the thoroughness and effectiveness of the long term methods now employed by some psychiatrists, the fact remains that the brevity of any method has an important bearing on the number of patients who can or will receive the needed benefit which the method of treatment may offer. The very magnitude of the problem of functional disease, involving as it does millions of patients, demands methods of diagnosis and treatment which are practical and readily available to all patients.

Much of this suspicion and hostility and many of the divergent views are probably due to the extreme isolation in which psychiatry has existed and developed since its origin. Cloistered as a rule in remote hospitals, psychiatrists seem to have been content to indulge in their own inconclusive factional controversies and to have shown little interest in communicating their knowledge to the other members of the medical profession and even less enthusiasm for keeping abreast of research and developments in fields other than their own.

---

[3] Gregg, A.: Am. J. Psychiat. **101**: 285, 1944.

Another serious barrier which has served to estrange the two groups even further, is the language difficulty. Perhaps in part as a result of their isolation, psychiatrists have developed a vocabulary of their own. Many of the words are not to be found in standard medical dictionaries. Or, if they do appear in any of these, the newer meanings or connotations assigned to them by psychiatrists may not even be mentioned. In addition to the obscurity of meaning, many of the terms selected by the analysts seem to other members of the medical profession ill chosen and unfortunate. Thus a specialty whose major medium is speech is further isolated from the other branches of the medical profession by the use of a vocabulary which is too frequently not understood by the uninitiated.

These examples of divergence in points of view, though by no means completely covering the field, are sufficient to show that it is high time that steps be taken to bridge this gulf, to bring to an end the isolation of psychiatry as a specialty and to integrate it thoroughly in all fields of medicine. There can be no question of the great advantage to the general practitioner and to his patients in having a sufficient knowledge of psychiatric technics and procedures to enable him to meet the problem of functional disease more adequately. To those physicians who have recognized this problem and attempted to cope with it in an intuitive fashion, psychiatry offers systematic and orderly technics for the understanding and handling of the emotional problems of the patient; and surely the introduction of an orderly and tested system is far better than the reliance on hit or miss methods. For those physicians who have ignored or denied the existence of functional disease and the effect of instinctual drives and emotional conflicts on the life of a patient, a knowledge of psychiatry will reveal an unknown field which they can no longer afford to neglect. The physician adequately trained in organic and functional disease should be able to recognize with little delay the primary underlying etiologic factors and, in the case of patients with functional disease, spare them the repetition of innumerable costly tests to which such patients are so frequently subjected. If he is to achieve this necessary knowledge and understanding of what psychiatric practice has to offer, the physician will require not only an open mind but also a far more receptive and generous attitude and a willingness to study the subject.

The psychiatrist, too, stands to reap real gains and a better balance through a more intimate knowledge of the researches and clinical developments in the other fields of medicine and should realize that in order to evaluate the whole patient it is equally essential that one have adequate knowledge of the soma as well as the psyche. Thus would emerge a growing mutual humility, respect and knowledge which, after all, are the cornerstones of integration.

Undoubtedly the most effective and logical place to attack this problem is in the medical schools. Only a few years ago the course in psychiatry consisted of a brief survey of the major psychoses. Recently, however, there have been significant advances in the teaching of psychiatry as a fundamental aspect of the basic general training. Instead of being taught only as a specialty, psychiatry should be elevated to a major position in the general medical curriculum and actively integrated with the clinical teaching in all departments of the school. The psychiatrists themselves are agitating to have psychiatry given a position in the medical curriculum as a basic science. But until psychiatry can move out of its world of controversy, theory and metaphysics and can establish a collection of more consistent, precise and proven data and phenomena, the other divisions of the medical profession are not likely to accept it as a basic science. It is my personal opinion that the future of medical education lies in a breakdown of preclinical and clinical barriers and in a much closer integration of all teaching and research activities rather than the setting up of new isolated departments. In the School of Medicine of Western Reserve University the preclinical foundations of psychiatry are being given in the first two years. In the third and fourth years instruction in psychiatry is closely integrated with work in other departments, particularly the Department of Medicine, in which the teaching is carried on jointly in order to give proper balance and coordination to the physical and the functional aspects. Additional training and correlation are being carried on into the medical internships and residencies in Lakeside Hospital, where each intern now spends four months in psychiatry early in the course of his internship.

A far more difficult problem is to bring to those physicians already in practice an opportunity to acquire some knowledge of recent psychiatric advances in the field of functional disorders. One obstacle is the lack of postgraduate courses in this subject and the inadequate number of psychiatrists able to teach in a manner convincing to experienced clinicians. Recently, an interesting and most worth while experiment in the postgraduate teaching of psychiatry was made in Minneapolis under the auspices of the Commonwealth Fund and the Division of Postgraduate Education of the University of Minnesota, with the purpose of finding out whether practicing physicians in a short postgraduate course could learn the gist of what psychiatry has to offer in the care of psychoneurotic patients. With eight young psychiatrists and an internist as teachers and twenty-five practicing physicians from Minnesota and nearby states as students, a two week course of lectures, conferences, clinics and interviews with patients was given. The patients were taken more or less as they came, mostly with chronic complaints such as every physician sees in his practice. The proof of the success of this original experiment is to be found in the comments of the physicians who were the students. Almost all of them considered that they had gained immeasurably in their insight into the physician-patient relationship, in their ability to view the patient as a whole rather than as the carrier of an isolated diseased organ or system and in the comprehension of a tried systematic method for dealing with functional disease.[4] A recent follow-up was made by the Commonwealth Fund by visiting the physicians who attended the course as students. The testimony was almost unanimous that the two weeks' training had proved an invaluable help in their practice.

While such a course may not be available to every physician at the moment, a strong demand to one's county, state and national medical societies for similar opportunities for instruction will, in due time, bring results. Similarly a demand for such postgraduate courses in the medical schools will eventually be met.

---

[4] Smith, G.: Psychotherapy in General Medicine, New York, Commonwealth Fund, 1946.

In the meantime some insight and knowledge of the problem may be gained by a study of the literature now available in this field. However, there seems to be a real need for textbooks giving a clearer presentation by psychiatrists of their concepts of the mechanisms of the emotions, as well as the simpler technics of treatment and the results of therapy.

In summary, the practitioner in all fields of medicine is confronted today with a major challenge, which is the recognition and proper handling of patients with functional disease. It is a challenge that he can and must meet, but in order to do so he must equip himself with additional knowledge of some of the precepts and technics of psychiatric practice. Even though new knowledge and technics in this field are acquired by practitioners in all departments of medicine, the challenge still stands, for the members of the profession must apply to this urgent problem of functional disease all the investigative and research skills which in the past fifty years have produced such epochal advances in the knowledge of organic disease. Only by a concentrated effort of medical schools, general practitioners, psychiatrists and specialists in the preclinical sciences can the members of the medical profession successfully cope with the problems created by functional disorders which will soon be, if they are not already, the greatest single cause of the symptoms which bring patients to a physician's office.

PSYCHOSOMATICS

The Liaison Between Internal Medicine and Psychiatry

EDWARD A. STRECKER, M.D.
Philadelphia

In the time at my disposal, in a field in which one book alone is fortified by 2,251 references to the literature, I can scarcely hope to do more than sketch a few basic ideas

Psychiatrists have not yet recovered from their surprise at the medical sensation produced by the introduction of the word psychosomatics into the language of medicine. They approve highly the provocative thinking induced by the word but are somewhat amazed that so frequently it is regarded as designating an original contribution. Psychosomatic medicine was announced at least two thousand five hundred years ago, when the wise Socrates on returning from the second Thracian campaign chided the Athenian physicians for not realizing, as did the Thracians, that the body would not be cured without the mind. "This," he said, "is the reason why the cure of many diseases is unknown to the physicians of Hellas, because they are ignorant of the whole."

Furthermore, no doubt stimulated by the dearth of instruments of precision, such as the electrocardiograph and being able to obtain at best a somewhat misty view of the central nervous system, psychiatrists long since began to view patients in their totalities as unified functioning organisms. At least a decade before the word psychosomatic was coined, psychiatry had insistently taught that man was a total and indivisible unit and therefore, in health and disease, every somatic process at once reverberated in all of the man and notably in his emotions; conversely, that every emotional reaction, whether violent and pathologic, like rage, or merely a feeling tone, perhaps a mild state of dissatisfaction or slight irritability, immediately had repercussions in every tissue and cell of the body. Not infrequently psychiatrists observe in some of the major psychoses and sometimes in hysteria patients who are cataleptic, that is, their limbs may be placed in awkward, strained positions which often are retained beyond the time limits of physiologic endurance, or patients in stupor, who are quite irresponsive to painful stimuli. Naturally, in view of these clinical phenomena, psychiatrists can accept readily enough the fact that headache, backache, nausea, vomiting, tachycardia and a host of other common symptoms often may represent the somatic expression of unresolved, unconscious emotional conflicts.

Finally, it is truly amazing that physicians for such a long time failed to understand the medical significance of the time immemorial experiences of our species, so common that they have become a part of every day language. From primitive man to Homo sapiens, human beings have been trying to explain to their medicine men, and later their physicians, that under stress of emotion they felt lumps in their throats, that their hearts jumped or stopped, that their stomachs dropped, that they had no guts or too much guts, that they were paralyzed with fear or blinded with rage, that they viewed the world with jaundiced eyes and so on. And yet physicians waited until this time to think scientifically in terms of psychosomatics.

Perhaps this is a suitable time to resurvey the progress that has been made in the application of the lessons of psychosomatics to the everyday practice of medicine and its specialties. While there are many exceptions, my experience leads me to believe that there is still far too wide a gap between the use of the word psychosomatic (and sometimes its glib use) and the deep understanding of what it really means and its therapeutic implications.

The sins of omission may be listed under three categories:

1. The continued overuse of various pharmacologic and physical therapeutic measures and the insufficient employment of psychotherapy. There is no reason why patients should not be given medicines or stomach lavage, gallbladder drainages, nose and throat treatments, massage, prostatic massage, hydrotherapy, heliotherapy, special corsets or what not; but if the illness is largely functional, the result of unsolved emotional conflict, then unless the patient clearly understands that these treatments and technics at best are adjunctive, merely supportive and ameliorative, and that the chief reliance must be on psychotherapy, there is grave danger that the symptoms will become irreversibly fixed—that catastrophe of hopeless chronicity. Like the bedeviled man in Scripture, the last state of that patient will be worse than the first.

In a recent article a well known ophthalmologist[1] concluded that "the precision of diagnostic and therapeutic procedure available to ophthalmology has led to a conspicuous neglect of psychic factors in ocular disease. That prolonged but reversible physiologic disturbance can eventually give rise to irreversible organic disease is no less true in the eye than in other body systems."

2. A definite tendency, which I still find to distinguish organic from functional by the fallacious criterion that in organic disease the symptoms are

---

Read in the General Scientific Meetings at the Ninety-Sixth Annual Session of the American Medical Association, Atlantic City, N. J., June 10, 1947.

[1] Harrington, David O.: Psychosomatic Disorders, J. A. M. A. 133: 669 (March 8) 1947.

objective, in functional illness subjective. Surely physicians should have learned at long last that such objective symptoms as tachycardia, vomiting, dermatitis, the many chemically demonstrable preliminary phenomena eventuating in anxiety-conditioned peptic ulcer and many other symptoms are often both objective and functional.

3. Too little understanding, which I believe still exists, of even a simplified framework of psychopathology. This should be built of living clinical facts, not armchair philosophic abstractions; and it must be accepted and understood that psychopathology is as real and as symptom-determining as is cirrhosis of the liver or valvular disease of the heart. Any one who wishes to practice psychosomatic medicine must have a workable concept of the structure of the human personality and the not conscious mind—a mind containing significant repressed material not accessible to everyday conscious awareness; of the hidden conflict between irreconcilable demands of the personality and of the many technics and mechanisms of defense which operate to produce the pathologic compromise, often presenting to the physician as functional psychosomatic illness. It must be realized that these psychopathologic disease evolving steps are as concrete as are the stages, let us say, between the chancre of syphilis and syphilitic aortitis. Furthermore, it must be realized that there is no universality of psychopathology. Neither is there in organic pathology. For instance, given infection by the bacillus of Koch, the particular bodily constitution becomes a factor in shaping the varying result—tuberculosis, acute or chronic, which may involve any organ or tissue of the body. So too are the particular markings of the personality influential in molding psychosomatic symptoms and helping to fix their location —cardiocirculatory, gastrointestinal, genitourinary or dermagenic. Each human personality, striving unconsciously to avert the catastrophe of psychic disorganization, utilizes the psychologic weapons which are the more natural and trustworthy for that particular personality.

Such an inference might be drawn by observing animal behavior when confronted with a threat to physical survival. Huge animals, such as elephants, charge the danger and attempt to demolish it by their poundage. Large cats, such as the tiger, add feline cunning to their muscular strength and agility and the tearing power of fang and claw. The opossum plays dead. Myriads of insects escape destruction by inconspicuousness—utilizing their natural camouflage to merge into the trunk of a tree or a blade of grass.

Psychiatrists regret that the word psychosomatic does not convey any intimation at all of the enormous influence of the environment not only in motivating psychosomatic illness but even in fixing the locus of the symptoms. It is a commonplace of practice to observe the significant role played in the determination of the site and pattern of psychosomatic symptoms in adults by the early emotional impact of organic disease in a parent in the highly personal framework of the childhood environment. And every physician knows how functional psychosomatic illness frequently is delineated and its location largely determined by the nature and conditions of the occupational and industrial environments.

Psychiatry has been the somewhat lonely and not always effectual torch bearer of the significance of the effect of personal, social and vocational environments in human functional disease. The psychiatrist needs help from internal medicine. As a beginning and in order to stimulate teaching, I propose the word psycho-enviro-somatic.

The real beginning of psychosomatics must be made in the preclinical years of medical education. Medicine not only has its physics or somatics but also its "psychics" or psychogenetics. There could be a true and helpful teaching parallel. In anatomy there are livers, hearts and spleens. So too is there an anatomy of psychology to be studied, consisting of normal emotions, consciousness, memory and the like. There is a physiology which teaches how organs work. So too should there be taught a physiology of how mental functions work. Paralleling histology, the microscopic study of normal organs and tissues, the student should be made familiar with the finer divisions of mental functioning; for instance, remote and recent memory, the gradations of normal consciousness, the variety of emotional shadings and their somatic profiles. When the Department of Pathology is demonstrating gross morbid lesions, syphilitic aortitis, liver abscess and what not, the Department of Psychiatry should be demonstrating the gross pathology of the mind, pronounced emotional deviations such as profound melancholia or rage and fear with their component bodily expressions. Likewise should there be dual teaching of microscopic pathology, on the one hand, let us say, the study of a cross section of an arteriosclerotic vessel or the walls of an abscess, on the other a span of amnesia or the psychosomatics of anxiety due to repressed emotional conflicts.

If the loaf of medical practice is to be thoroughly leavened, the medical student must be given from the very first week in medical school the opportunity of studying all of man and not only a hypothetical somatic half.

111 North Forty-Ninth Street.

CARBOHYDRATE METABOLISM IN OSTEITIS DEFORMANS, OR PAGET'S DISEASE

ROBERT C. MOEHLIG, M D.
and
H. LYMAN ABBOTT, M D
Detroit

In the following report of 2 cases of osteitis deformans, or Paget's disease, we wish to reemphasize the close relationship between calcium and carbohydrate metabolism that has been observed clinically by us in cases involving an osteolytic or osteogenic process such as is seen in osteoporosis and Paget's disease.[1] It is our purpose to show that carbohydrate metabolism is disturbed in osteitis deformans. First, we shall report 2 illustrative cases in which there was a pronounced familial incidence of diabetes mellitus. Second, we shall cite evidence of a high familial incidence of diabetes in 42 other cases of the disease; in addition there was a high incidence of obesity and tallness in the families of these. Third, we shall prove that there is a lowered dextrose tolerance in Paget's disease.

From the Department of Internal Medicine, Harper Hospital

Soc **45:** 642 646 (May) 1946 (b) Moehlig, R C Paget's Disease and (Osteitis Deformans) Osteoporosis, Surg, Gynec & Obst **62:** 815 822 (May) 1936; Osteoporosis Due to Carbohydrate and Calcium Metabolism Disturbances, J. Michigan M Soc, **37:** 509 515 (June) 1938 Moehlig, R. C, and Adler, S · Carbohydrate Metabolism Disturbance in Osteoporosis and Paget's Disease, Surg, Gynec & Obst **64:** 747 757 (April) 1937.

REPORT OF CASES

As illustrative of an almost certain biologic, inherited carbohydrate disturbance which resulted in Paget's disease, we submit the following case histories, which illustrate this inherent tendency.

Case 1.—*History.*—B. W., a white man aged 58, weight 160 pounds (72.7 Kg.) and height 66 inches (167.6 cm.), was first seen by us on Oct. 10, 1946. His main complaints were of the gradual onset eight years ago of deafness, occasional attacks of dizziness, low back pain, a noticeable increase in his head size and a gradual decrease in stature, associated with anterior and lateral bowing of his legs. He had been extremely fond of sweets and candy for the past fifteen years. His past history was essentially noncontributory.

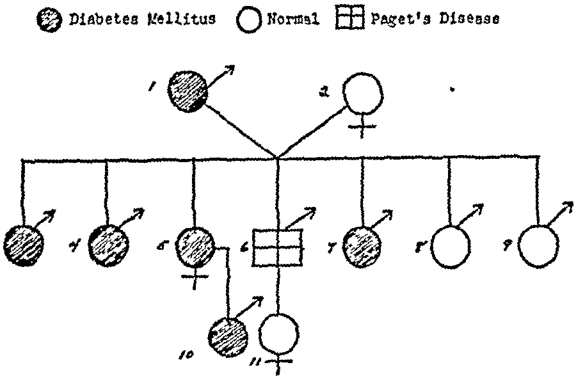

Fig. 1 (case 1).—Inherent tendency to disturbance in carbohydrate metabolism: complete data are given in the family history on 1, father; 2, mother; 3 and 4, brothers; 5, sister (these five are dead); 6, patient; 7, 8 and 9, brothers; 10, nephew, and 11, daughter of the patient.

Family History.—The father of the patient was 72 inches (182.8 cm.) tall, weighed 225 pounds (102.7 Kg.) and died at the age of 72 of advanced arteriosclerotic cardiovascular disease associated with diabetes mellitus. The mother of the patient was 66 inches (167.6 cm.) tall, weighed 150 pounds (68.2 Kg.) and died at the age of 77 of cardiac disease of unknown type. The patient had one brother who was 66 inches (167.6 cm.) tall, weighed 230 pounds (104.5 Kg.) and died at the age of 52 of diabetes mellitus. Another brother was 67 inches (170 cm.) tall, weighed 175 pounds (79.5 Kg.) and died at the age of 19 of diabetes mellitus. One sister was 70 inches (177.8 cm.) tall, weighed 160 pounds (72.7 Kg.) and died at the age of 40 of diabetes mellitus; her only living son, now aged 23, has an extremely severe type of diabetes mellitus. The patient has three living brothers; one is 60 years of age, 68 inches (172.7 cm.) tall, weighs 225 pounds (102.7 Kg.) and is apparently healthy; another brother, aged 54, height 69 inches (175 cm.) and weighs 210 pounds (95.4 Kg.), has renal calculi; another brother who is 48 years of age, 69 inches (175.2 cm.) tall and weighs 230 pounds (104.5 Kg.) has diabetes mellitus. The daughter, and only child, of the patient is now 32 years of age and apparently healthy, but during her teens she had amenorrhea associated with a goiter and was given calcium by her physician (fig. 1).

Physical Examination.—The patient was a well nourished, elderly man, who exhibited a large head, decided dorsal kyphosis and bowing of the legs anteriorly and laterally. Other than this and a palpable adenoma in the left lobe of the thyroid gland, the examination revealed essentially normal conditions.

Laboratory Data.—The urine was clear and gave normal results to routine laboratory analysis. Examination of the blood revealed: hemoglobin 14.7 Gm. by the Sahli method; erythrocytes 5.1 million; leukocytes 10,900, with a normal differential count. The blood chemical studies revealed a negative reaction to the Kahn test; the fasting blood sugar was 104 mg., nonprotein nitrogen 39 mg., serum cholesterol 303 mg., calcium 10 mg., and phosphorus 3.1 mg., per hundred cubic centimeters; the acid phosphatase was 4.5 units and alkaline phosphatase 117.9 units (modified King and Armstrong method). The electrocardiographic curve was normal. The dextrose tolerance curve (the alimentary standard one dose test) showed values in the blood as follows: fasting 104 mg., after one-half hour 186 mg., after one and one-half hours 189 mg. and after two and one-half hours 89 mg., per hundred cubic centimeters. The urinalysis for sugar was negative for each sample.

Roentgen studies of the skull, the right humerus and the pelvis revealed "changes having the appearance of fibrocystic disease such as is seen in Paget's disease."

Case 2.—*History.*—Miss M. M., a white woman aged 40, weight 160 pounds (72.7 Kg.) and height 66 inches (167.6 cm.), was first seen by one of us in March 1923 with the main complaint of pain in the low lumbar area of the back, pain in both thighs and a gradual onset of deafness, which was progressively becoming worse. (She was totally deaf by May 1935.) She also had severe pain in the right renal area; this required the analgesic use of morphine. The past history was essentially noncontributory.

Family History.—The father of the patient was 74 inches (187.9 cm.) in height and weighed 250 pounds (113.6 Kg.); he died at the age of 60 with diabetes mellitus. The patient's mother, whose height and weight are unknown, died at an early age of diabetes mellitus. One brother is living; he is 68 inches (172.7 cm.) tall, weighs 175 pounds (70.5 Kg.) and has diabetes mellitus, gallstones, renal calculi and Paget's disease. One sister is living; her height is 65 inches (165.1 cm.) and her weight 145 pounds (65.9 Kg.). She has Paget's disease and a diabetic dextrose tolerance curve (fig. 2).

Physical Examination.—Essentially normal conditions except for a pronounced dorsal kyphosis were revealed by physical examination.

Laboratory Data.—Laboratory determinations were within essentially normal limits except for a blood alkaline phosphatase level of 63 units (modified King and Armstrong method). The dextrose tolerance curve (the alimentary standard one dose test) showed values in the blood as follows: fasting 140 mg., after one-half hour 246 mg., after one and one-half hours 280 mg. and after two and one-half hours 180 mg., per hundred cubic centimeters; the urinalysis showed a trace of sugar in each of the last two samples.

Roentgen studies of the skull and pelvis revealed changes characteristic of Paget's disease. A right ureteral calculus was also present.

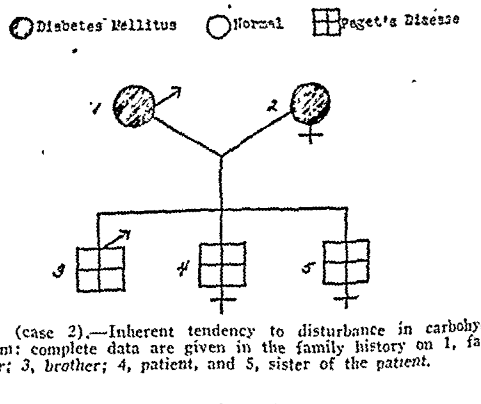

Fig. 2 (case 2).—Inherent tendency to disturbance in carbohydrate metabolism: complete data are given in the family history on 1, father; 2, mother; 3, brother; 4, patient, and 5, sister of the patient.

COMMENT

Today the view is generally held that Paget's disease is not a generalized systemic disease. As Bauer[2] said, "The preponderance of clinical, biologic and pathologic data does not favor its being a generalized systemic disease of either infectious or endocrine origin."

We consider, on the other hand, that the biologic and clinical evidence favors the view that it is a systemic disease. Phosphatase, an enzyme which hydrolyzes phosphoric esters, is decidedly elevated in

---

[2] Cecil, R. L.: Textbook of Medicine, ed. 6, Philadelphia, W. B. Saunders Company, 1943, p. 1329.

Paget's disease—more than in any other disease. Since this enzyme is concerned with both carbohydrate metabolism and the development of the osseous system, the history of familial diabetes, obesity and tallness and the important fact that 29 of our series[1a] of 33 patients with Paget's disease had a diabetic dextrose tolerance curve, point unmistakably in the direction of a systemic disease.

In a previous article[1a] we reviewed 40 cases of Paget's disease, in 13 of which we noted a familial history of diabetes mellitus. There were 35 patients who had one or more members in their immediate families who were 71 inches (180 cm.) or more in height. Thirty of the group had one or more members in their immediate families who weighed 200 pounds (90.9 Kg.) or more. Dextrose tolerance tests were made in 31 of the cases: in 27 there was a diabetic type of curve, and in 4 it was normal.

The fact that such a high percentage of our patients with Paget's disease came from obese families is also evidence pointing to a disturbed carbohydrate metabolism, for it is common knowledge that obesity is a predisposing factor in diabetes mellitus.

In the same paper[1a] we reviewed 94 osteoporotic cases. We found similar familial tendencies. No patient in our series of 94 osteoporotic cases presented symptoms of diabetes mellitus, but 33 patients gave a familial history of diabetes mellitus. Eighty-two patients had one or more members in their immediate families who were 71 inches (180 cm.) or more in height. Seventy-four patients had one or more members in their immediate families who weighed 200 pounds (90.9 Kg.) or more. Of those 40 osteoporotic patients on whom we were able to perform a dextrose tolerance test,[3] 35 had diabetic type curves and 5 had a normal or increased tolerance.

It is important to note that those diseases which involve carbohydrate metabolism also produce changes in calcium metabolism. Diabetes mellitus, as is well known, is associated with deposition of calcium in the blood vessels.

Thyrotoxicosis is usually associated with a lowered sugar tolerance, and at times frank diabetes mellitus is present. Frequently thyrotoxicosis produces osteoporosis. A negative calcium balance with a normal serum calcium is present in this condition. Patients with thyrotoxicosis are subject to calculi of the urinary tract. Deposits of calcium in the blood vessels, spleen, uterus and soft tissue structures are not uncommon.

Pituitary basophilism is another disease in which carbohydrate metabolism is accelerated. Here too, osteoporosis is one of the cardinal signs of the condition. The serum calcium is normal however.

Acromegaly, which is associated frequently with frank diabetes mellitus and a lowered carbohydrate tolerance, also has as a cardinal sign osteoporosis. Both pituitary basophilism and acromegaly produce kyphosis as a result of osteoporosis. These clinical conditions have at least two things in common, a disturbance in carbohydrate metabolism and a disturbance in bone structure.

Hyperparathyroidism is another disease associated with a calcium metabolic disturbance and pathologic changes in the bones. The metabolic manifestations of this disease are: hypercalcemia; hypophosphatemia; increased urinary excretion of calcium, and increased serum phosphatase activity.

In regard to hyperparathyroidism and these metabolic changes certain experimental work is of interest and pertinent to the present discussion. Moehlig, Murphy and Reynolds[4] in discussing a phase of the metabolic changes, said:

> Ferrannini[5] found that in normal subjects parathyroid extract lowers the glycemic rate during fasting and increases carbohydrate tolerance. The action of the parathyroid extract on the glycemic curve, when compared with that of epinephrine, is almost like that of insulin. In diabetes the parathyroid extract lowers the glycemic curve and the glycosuria *on fasting*. He says there is no doubt about the insulin-like action of parathyroid extract in normal subjects and in diabetic patients.
>
> Johnson[6] administered calcium gluconate alone and in combination with parathyroid extract to 6 dogs under ether anesthesia, and the blood sugar changes were noted. Following the administration of calcium gluconate and calcium gluconate in combination with parathyroid extract the portal vein blood sugar fell rapidly and continuously during the period of the experiment. The lowest levels were reached under the influence of the combined action of calcium gluconate and parathyroid extract (*both given intravenously*). In the control animals the portal blood sugar showed a consistent rise, as might be expected under the influence of ether anesthesia. From these experiments he concluded that the fall of the blood sugar is due to *impaired absorption* of glucose from the gastrointestinal tract. He pointed out in this paper that the extent of the fall was in relationship to the original level of the blood sugar—the higher the original level, the greater the extent of the fall. He further pointed out that the fall in blood sugar paralleled the rise of blood calcium and that there was *a rather definite inverse relationship.*

Funsten[7] reported disturbances in carbohydrate metabolism in patients with fractures.

Moehlig, Murphy and Reynolds[4] attempted to produce Paget's disease in dogs by the use of anterior pituitary extract and parathyroid extract. Among the effects noted in dogs on a high carbohydrate diet and parathyroid extract, were a rise in blood calcium and a lowering of the blood sugar, phosphorus and phosphatase. These effects were transitory.

All 4 dogs used in the experiment showed a rise in blood calcium when glucose ("karo corn syrup") was added to the diet.

This evidence suggests that there is a close relationship of carbohydrate metabolism to calcium metabolism.

SUMMARY

Two cases of osteitis deformans (Paget's disease) are reported, in which the family history of diabetes mellitus is outstanding.

The father, three brothers and a sister of 1 patient had diabetes mellitus; a niece of the patient also had diabetes.

Both parents of the other patient had diabetes mellitus, and all three siblings had Paget's disease. In addition, one of the siblings had diabetes mellitus and the other two (including the patient) showed a diabetic type of dextrose tolerance curve.

Previous papers have shown the high incidence of familial diabetes, tallness and obesity in both Paget's disease and osteoporosis.

---

[3] We used 100 Gm. of dextrose orally on a fasting stomach.

[7] Funsten, R. V.: The Effect of Fractures on Blood Sugar, J. Bone & Joint Surg. **17:** 769-773 (July) 1935.

Evidence supporting the view that Paget's disease is a systemic disease associated with a disturbance in carbohydrate metabolism has been submitted. Furthermore, those diseases (diabetes mellitus, thyrotoxicosis, pituitary basophilism, and acromegaly) which involve carbohydrate metabolism also produce changes in calcium metabolism with accompanying changes in the bones. There is a relationship between hyperparathyroidism and carbohydrate changes.

We are hopeful that others will perform dextrose tolerance tests on their patients with Paget's disease and also obtain a detailed family history in regard to the occurrence of diabetes, obesity and tallness. We are firmly of the opinion that if this is done the evidence that Paget's disease is a systemic one will be strengthened and will lead to a determination of its true etiologic basis.

ARTERIOVENOUS FISTULAS

Their Effect on the Circulation

DANIEL C. ELKIN, M.D.
and
JAMES V. WARREN, M.D.
Atlanta, Ga.

Patients with arteriovenous fistulas are seen with relative infrequency in civilian practice, and therefore clinical impressions concerning them have been based on a rather limited experience. The establishment of centers for the treatment of vascular injuries in certain Army general hospitals afforded an unprecedented opportunity to study a large number of such patients. The first of these Vascular Surgery Centers was established at Ashford General Hospital in March, 1943. At this hospital over 375 patients with arteriovenous fistulas were observed and treated by operative means. This report summarizes our experience in regard to the effect of this type of lesion on the circulation.

Prior to injury the patients had been healthy young men (there were 2 women) with no evidence of cardiovascular disease. The arteriovenous fistulas, all the result of trauma, were of various sizes and occurred in practically every named blood vessel of the body with the exception of the aorta. Most of the patients were seen within two to four months after injury, although in a few instances the interval was as long as two years.

It is not the purpose of this paper to discuss in detail the pathogenesis and diagnosis of these lesions. Most of them were produced by small wounds due to the fragmentation of high explosive shells, land mines or grenades. As a rule the external wound was small; thus the imbrication of muscle and fascial planes prevented external hemorrhage of a severe degree, and bleeding was usually readily controlled by pressure. The simultaneous injury of a closely associated artery and vein, particularly if enclosed within a fascial sheath, was believed to be the immediate cause of the arteriovenous shunt. However, in a few instances a blow with a blunt instrument apparently produced the communication between the vessels without producing an external wound.

LOCAL CIRCULATORY MANIFESTATIONS OF ARTERIOVENOUS FISTULA

Regardless of the site of the lesion, the local evidences of an arteriovenous fistula are similar. The most common sign is the bruit, or murmur, which can be heard with a stethoscope in the region of the fistula. In contrast to the purely systolic sound of an arterial aneursym, that produced by an arteriovenous fistula is a continuous murmur extending through both systole and diastole. Systolic accentuation of this sound results in its distinctive character. Although in general the larger the fistula the louder the murmur, this is not always true. At times small fistulas may produce loud murmurs. These murmurs, like those arising from the heart, may be transmitted a considerable distance from the site of origin. The chief cause of failure to hear the murmur is simply failure to listen for it.

If the murmur is of sufficient intensity, a thrill may be felt. Again, although somewhat indicative of the size of the fistula, the intensity of the thrill is not a completely reliable evidence of this fact, since it may be modified by the position of the fistula and the structures overlying it. The thrill is less well transmitted than the murmur and is localized to an area near the lesion.

A pulsating mass of variable size may be caused by aneurysmal dilatation of either the involved artery or vein or by a false sac in the region of the fistula. In many instances, however, there are no external evidences of either arterial or venous dilatation. The superficial veins near the fistula or distal to it are dilated and tortuous in most instances (fig. 1). This dilatation disappears soon after the fistula is removed (fig. 2). Although the pressure in these veins is elevated, the systemic venous pressure is normal in the absence of cardiac failure.[1] Blood withdrawn from the veins near the fistula has an abnormally high oxygen

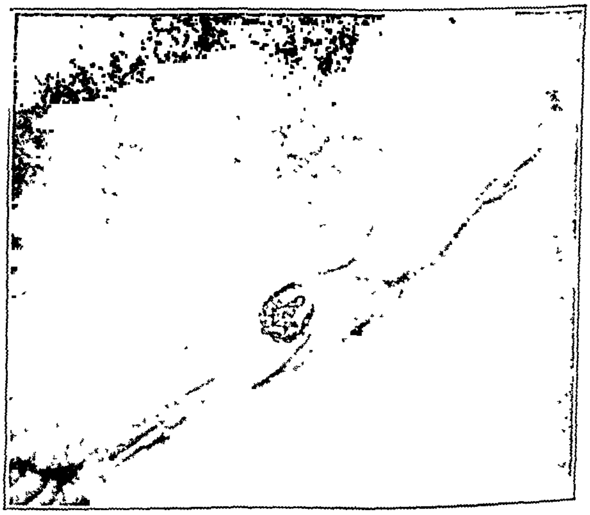

Fig. 1.—Brachial arteriovenous fistula showing dilatation and tortuosity of the superficial veins.

content.[2] In the early stages the area supplied by the artery distal to the fistula may show evidence of deficient circulation. This may vary from mild evidences of circulatory insufficiency such as pallor and coolness of the part to the more severe manifestations such as gangrene or cerebral anemia. Skin temperature and oscillometric measurements confirm these observations (fig. 3). At times there is edema about the fistula or of an extremity distal to the lesion. In the region of the fistula the skin is usually warmer than normal. Oscillometric studies reveal increased pulsations at the site of the fistula, but they diminish gradually as one measures them toward the heart and are decreased distal to the lesion.

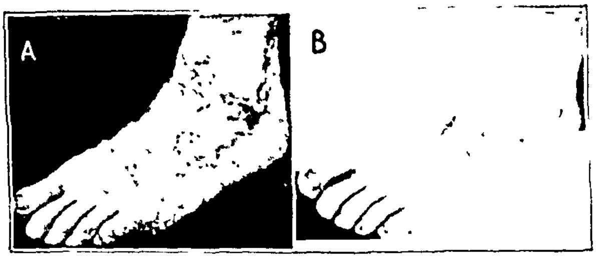

Fig. 2.—A, plantar arteriovenous fistula showing dilatation and tortuosity of the superficial veins. B, the same, two weeks after excision of the fistula

As viewed at operation, the proximal artery and vein are usually dilated (fig. 4). The artery distal to the fistula is more frequently small, the size depending on the amount of blood shunted away from it through the fistulous communication. The vein distal to the fistula is usually dilated because of the shunting of arterial blood into it. In the region of the fistula all collateral branches, both venous and arterial, are increased in size.

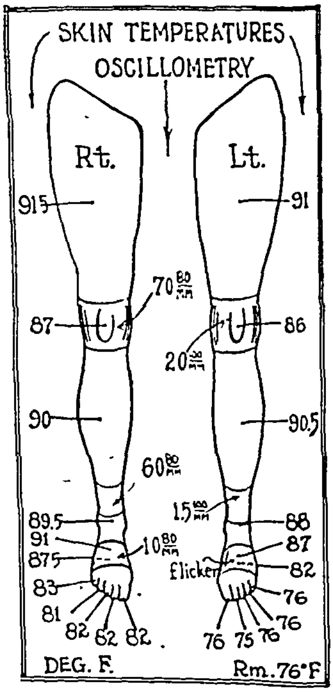

Fig. 3.—Left femoral arteriovenous fistula. Note decreased oscillations and skin temperatures distal to the lesion.

SYSTEMIC MANIFESTATIONS OF ARTERIOVENOUS FISTULAS

On physical examination of the patients with arteriovenous fistulas the heart usually presents no abnormalities. However, in many patients there is an alteration in the size of the heart which can be detected only by the decrease in the transverse diameter of the heart as measured in the teleoroentgenogram after operative eradication of the fistula.[3] On only relatively infrequent occasions is this increased size in excess of the normal standards, therefore it is noted only by the comparison of films made before and after removal of the fistula (fig. 5). Occasionally, however, the heart may become considerably enlarged (fig. 6). Since the change is reversible soon after removal of the fistula, it is assumed that this enlargement represents dilatation rather than true hypertrophy. In patients with fistulas of long standing irreversible hypertrophy may occur. In a small group of patients specially studied, changes occurring in the size of the heart immediately on obliteration of the fistula by compression have not been observed.[4]

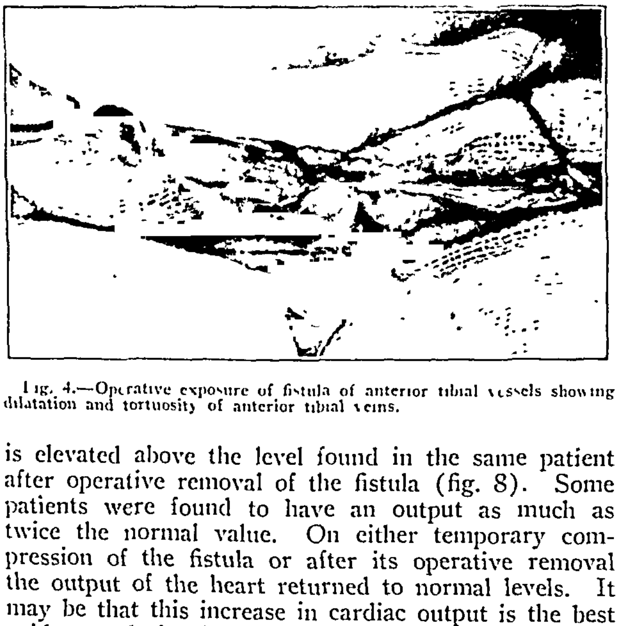

Fig. 4.—Operative exposure of fistula of anterior tibial vessels showing dilatation and tortuosity of anterior tibial veins.

Cardiac output measurements have been made on 47 of our patients by means of the critically damped low frequency ballistocardiograph[5] (fig. 7). This instrument is used to measure the cardiac output from the recoil of the body resulting from each heart beat. The validity of the ballistocardiograph in patients with arteriovenous fistulas has been confirmed by comparative studies with almost simultaneous cardiac output determinations by the technic of right atrial catheterization.[1] Our observations revealed that in slightly over one half of the patients studied, the basal cardiac output is elevated above the level found in the same patient after operative removal of the fistula (fig. 8). Some patients were found to have an output as much as twice the normal value. On either temporary compression of the fistula or after its operative removal the output of the heart returned to normal levels. It may be that this increase in cardiac output is the best evidence of the functional size of the fistula,[6] since either actual measurement of the size of the fistula or estimation of its size from the physical signs is subject to considerable error. Although those patients with the greatest increase in cardiac output had fistulas involving large vessels, it must be remembered that a fistula involving the larger vessels, such as the femoral artery and vein, may actually be of small size and accompanied by only a minimal increase in cardiac output. We have been unable to confirm the observation that the actual proximity of the fistula to the heart is in itself an important factor.[7] It appears to us that a fistula of a vessel close to the heart may cause either a large or small increase in cardiac output. The size of the fistula and of the vessels feeding it are more important than its position in determining the amount of blood flowing through it.

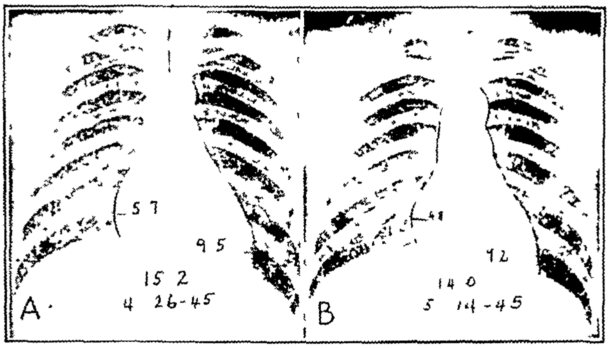

Fig. 5 *A*, femoral arteriovenous fistula Preoperative teleoroentgenogram of the heart showing approximately normal size and contour *B*, postoperative teleoroentgenogram of the same patient showing a decrease in the size of the heart

Arterial pressure measurements in our patients have not revealed striking abnormalities except that the pulse pressure is usually increased caused predominantly by a lowering of diastolic pressure. As has been pointed out by others, the pulse may assume the character seen in aortic insufficiency with a rapid upstroke and decline, tending toward a so-called water-hammer pulse. The heart rate in most of our patients was not remarkable In some, however, particularly those with fistulas involving large vessels, the basal pulse rate was somewhat elevated above normal. Although the local venous pressure about the fistula may be elevated, the venous pressure elsewhere in the body, including the right atrial pressure, is normal.[1] Roentgenographic examination may reveal evidence of pulmonary congestion. Generalized edema may occur in rare instances but is not common except in patients with a fistula of large size or long duration.

Observations on the blood volume were made in 40 of our patients.[8] The plasma volume was determined by the use of the blue dye T 1824. The total blood volume was calculated from the plasma volume and hematocrit reading. These data are reported in detail elsewhere, but in general slightly over half of the patients showed no difference in blood volume before and after operative removal of the fistula. On the other hand, the remaining patients showed a significant decrease in blood volume after removal of the fistula. This change amounted to as much as 1,000 cc. per square meter of body surface (fig. 9). The postoperative values in these patients were within the usually accepted normal range, hence it is interpreted that they had a significant elevation of blood volume with the fistula intact. This increase was not well correlated with the increase in cardiac output or heart size, but usually the larger blood volumes were observed in patients with clinical evidences of a large fistula.

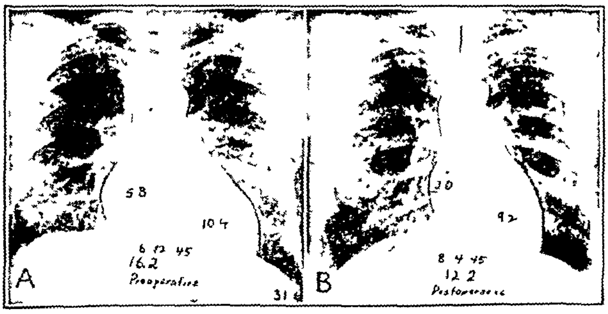

Fig 6—*A*, femoral arteriovenous fistula. Preoperative teleoroentgenogram of the heart showing an increase in the transverse diameter *B*, the same after excision of the fistula showing return to normal size

Although not present in our patients, it is well recognized that frank congestive heart failure may occur either early or late in the course of the condition. The increases in blood volume and heart size noted in some of our patients may actually have meant incipient cardiac failure.

Several circulatory changes occur on temporary occlusion of the fistula. Occlusion can be produced manually or with a blood pressure cuff.[9] The most commonly recognized of the circulatory responses is the slowing of the pulse rate, usually referred to as Branham's sign.[10] We have observed that this occurs in almost all instances in which compression of the fistula is possible and has not been observed in any of our patients with simple arterial aneurysms. Hence, we believe that this slowing of the pulse rate is a valuable diagnostic sign in the differentiation of purely arterial lesions from those which involve an arteriovenous communication. As previously found,[11] this change in the pulse rate is blocked by atropinization; hence it is apparently mediated by the vagus nerve (fig. 10). In addition to, and independent of, the pulse changes, we have found that there is almost immediate lowering of the cardiac output and stroke volume of the heart on compression of the fistula. This latter reaction is not blocked by atropine, and since it occurs so rapidly and without change in right atrial pressure,

it appears to be a nervous reflex related to the sudden change in resistance against which the heart must pump. The pulse pressure decreases on occlusion of the fistula because of the rise in diastolic pressure, thus returning the character of the pulse to a normal type.

COMMENT

The fact that a small and relatively unimpressive local lesion can bring about these varied circulatory reactions has aroused the interest of the members of the medical profession for many years. Even though considerable study of the problem has been carried out, we remain so ignorant of many basic facts regarding the circulation that a thoroughgoing explanation of all the phenomena associated with arteriovenous fistulas is not possible at this time. We are quite unaware, for instance, of the factors regulating the size of the blood volume in normal subjects. Enough new advances have been made, however, to warrant a reevaluation of the mechanisms which result in the circulatory manifestations of arteriovenous fistulas.

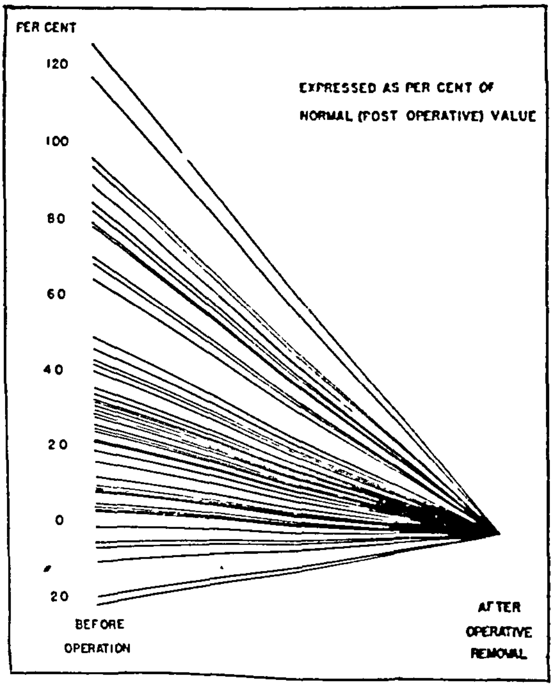

Fig 8.—Summary of observations regarding the effect of arteriovenous fistula on cardiac output. It is noted that in many instances there is a pronounced decrease in output after operative removal. A change of less than 20 per cent in cardiac output is considered within the range of normal variation.

The basic alteration in the circulation is a direct and sizable communication between an artery and a vein. Because of the difference in pressure in the two vessels blood will flow from artery to vein. The amount of blood shunted will depend, at least in part, on the difference in pressure between the two vessels and the size of the fistulous tract. It will be limited by the total amount of blood flowing into the area. Thus, a fistula involving a large artery might either result in a large or small shunt of blood, while a fistula fed from a small artery must be limited in size by the relatively small arterial inflow. The increase in cardiac output noted in our patients, probably an index of the amount of blood shunted, demonstrates this fact.

The other local changes in the vessels near the fistula are of interest. Since there is a direct opening from artery into vein, at some area in the vein one would expect an increased pressure, although it might be extremely small. Because of the elasticity and capacity of the venous system this increase need not become widespread. How far this pressure would spread depends on such factors as the size of the fistula, the elasticity of the vein, the valves in the vein and the size of the venous bed draining the area. Actual observations of the local changes in pressure fit with these concepts. The dilated venous channels appear to result from the increased volume and pressure of blood in the venous system locally. The veins may be dilated without much increase in pressure. Thus, as in filling a balloon the first increments of gas serve primarily to distend and fill it out, only later does an additional volume significantly increase the pressure; which is affected without much change in size.

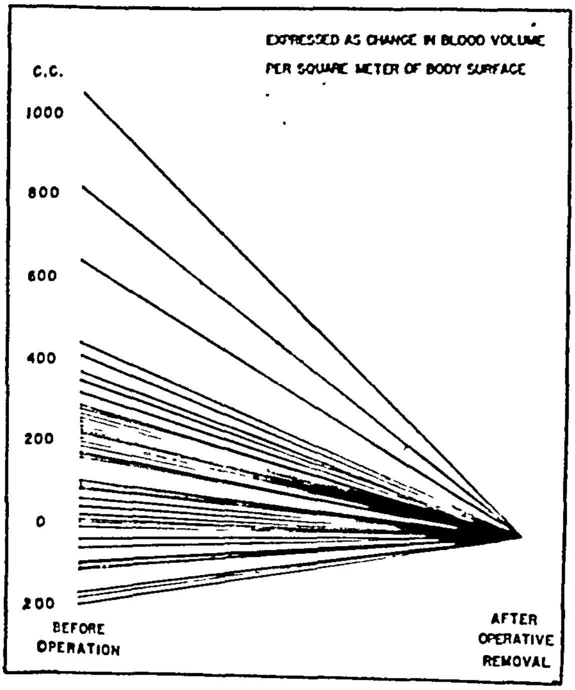

Fig. 9.—Composite chart showing decrease in blood volume after operative removal of an arteriovenous fistula. A change of 200 cc. in blood volume is considered within the range of normal variation.

	BALLISTOCARDIOGRAM	PULSE RATE	STROKE VOLUME	CARDIAC INDEX

AFTER ATROPINE FISTULA OPEN		120	151	9.3
AFTER ATROPINE FISTULA OCCLUDED		120	94	5.8

Fig. 10.—Popliteal arteriovenous fistula. Ballistocardiograms showing decrease in pulse rate, stroke volume and cardiac index on occlusion of the fistula before and after the intravenous administration of 2 mg. of atropine sulfate. Note that after administration of the drug the pulse rises but is not slowed on occlusion of the fistula. However, the stroke volume and cardiac index decrease.

The needs of the bodily tissues appear to play a major role in determining the output of the heart. With much blood shunted uselessly through the fistula, it is not surprising that in most instances there is a large cardiac output. The increased output occurs not as a result of changes in the pressure of blood presenting to the right side of the heart, but rather because of the changes on the arterial side of the circulation. As in other conditions in which the output of the heart is increased, such as anemia and exercise, the pulse rate may or may not be increased.

The increase in the size of the heart in many patients with an arteriovenous fistula has been demonstrated many times. It has been suggested that this is due to the increased blood volume. Experiments carried out on dogs by Holman [12] showed that variations in the blood volume were accompanied by a definite change in the size of the heart. The relative alterations in blood volume in these animals, however, were much greater than those seen in patients with arteriovenous fistulas. In addition, studies on normal human subjects have revealed that on rapidly varying the blood volume approximately 1 liter, no significant change in the size of the heart is noted.[13] Finally, our observations failed to demonstrate a good correlation between heart size and blood volume. Although in general those patients with large increases in blood volume had greater changes in heart size, there were noticeable exceptions, in which there was striking change in one without change in the other. We believe, therefore, that while the changes in blood volume may contribute some to the variation in cardiac size seen in these patients, other important factors probably exist. In patients with sustained increased demands on their hearts, such as those with severe anemia, thyrotoxicosis or hypertension, there may develop cardiac enlargement. The increase in the size of the heart in patients with arteriovenous fistulas may be on a similar basis. Just as a group of patients with the same degree of hypertension may demonstrate widely variable amounts of cardiac enlargement, one would not expect a direct correlation of the size of the fistula with the size of the heart.

There has been considerable controversy regarding the blood volume in patients with arteriovenous fistulas. Our observations support the belief that in at least some patients an increase does occur. Holman's [7] explanation that this increase results as a compensatory factor for that blood diverted through the fistula does not appear to offer an adequate explanation. One must be careful to distinguish between the actual volume of blood flow and the blood volume. A part of the body, such as the hand, may contain little blood yet have a large amount of blood flowing through it per minute. It has been suggested that the increased blood volume may represent the plethora seen in cardiac failure in general, rather than anything specifically due to the arteriovenous fistula. This may be true, although none of the patients in whom we found the elevated blood volume, had frank congestive heart failure. Another possibility is that with the distention of the vascular bed in the area of the fistula and great veins, the rest of the body will have a subnormal amount of blood. Thus, the mechanisms controlling the amount of blood may be stimulated, and as a result more blood is produced.

SUMMARY

The large number of vascular injuries in World War II have presented us with the unusual opportunity of observing almost 400 patients with arteriovenous fistulas. The local and systemic effects of this type of lesion on the circulation have been studied. Particular attention has been paid to changes in the size of the heart, cardiac output and blood volume. In many of our patients the cardiac output and blood volume were elevated above normal levels and the size of the heart was increased. After operative eradication of the fistula there was a return of these functions to normal. In none of our patients did there develop frank congestive failure of the heart. In addition, studies have been made of the circulatory changes which occur on temporary occlusion of the fistula.

A more nearly complete and rational explanation of the genesis of the effects of an arteriovenous fistula on the circulation awaits an extension of our basic knowledge in regard to the circulatory system.

CARONAMIDE FOR INCREASING PENICILLIN PLASMA CONCENTRATIONS IN MAN

J. WILLIAM CROSSON, M.D.
WILLIAM P. BOGER, M.D.
CHRISTOPHER C. SHAW, M.D.
and
A. KATHRINE MILLER, Ph.D.
Philadelphia

A new drug, caronamide,[1] when given orally to patients receiving penicillin produces a physiologic and reversible inhibition of the excretion of this antibiotic, which results in elevation of the concentration of penicillin in the plasma.

The primary objective of penicillin therapy is the maintenance of therapeutic concentrations of the antibiotic in the body tissues, but there appears to be no general agreement concerning therapeutic concentrations. Nor has it yet been made clear whether the maintenance of a constant level of penicillin plasma concentration is more desirable than the attainment of intermittent and temporary high levels. There does appear to be general agreement, however, that the attainment of high concentrations of penicillin is desirable.

It is difficult to attain elevated concentrations because of the rapidity with which penicillin is absorbed from the site of injection and excreted by the kidneys. Efforts have been made to maintain plasma concentrations of the drug above the commonly accepted therapeutic level (0.03 unit per cubic centimeter) [2] (*a*) by increasing the dosage of penicillin and by giving injections more frequently; (*b*) by varying the route of administration (constant intravenous infusion and intramuscular drip); (*c*) by slowing the absorption of penicillin (cooling the site of injection and using a suspension of penicillin in beeswax and oil); (*d*) by suppressing the excretion of penicillin by the renal tubules (iodopyrin injection

---

The work herein reported was made possible by the cooperation of Garfield C. Duncan, M.D., Director of the Division of Medicine, Pennsylvania Hospital, who granted permission for the study of patients on the medical wards.

[1] Caronamide is 4′-carboxyphenylmethanesulfonanilide and is prepared by Sharp & Dohme, Inc., Philadelphia.

["diodrast" N. N. R.],[3] para-aminohippuric acid,[4] benzoic acid and sodium benzoate).[5]

The large losses of penicillin in the urine were observed early in the use of the antibiotic, and actually in the days when it was less plentiful it was recovered from the urine for reuse in therapy.[6] The need for sustained high plasma concentrations of penicillin for the treatment of resistant infections has stimulated renewed interest in the possibility of conserving the drug by reducing the rate of its elimination by the kidneys.

Normally, approximately 80 per cent of penicillin in the urine is excreted by the renal tubules[7] and only about 20 per cent by glomerular filtration. It is apparent, therefore, that an agent capable of suppressing the tubular excretion of penicillin would be of value to the extent of its efficiency in producing such a suppression without causing toxic manifestations in the patient. It was first noted that iodopyrin injection, a commonly used radiopaque medium employed in urography and for determining the functional capacity of the renal tubules, was capable of suppressing the excretion of penicillin.[3] Para-amino-hippuric acid, which also is used to determine the functional capacity of the renal tubules, has been found to suppress the excretion of penicillin.[8] Thus two substances that were known to be excreted by the renal tubules were found to inhibit the excretion of a third substance, penicillin.

It has been shown that by the maintenance of high plasma concentrations of either iodopyrin injection or para-aminohippuric acid it is possible to suppress completely the excretion of penicillin by the tubules. This requires, however, the intravenous administration of such large amounts of either of the two compounds that their routine use to inhibit the excretion of penicillin is not practical. Nevertheless, both substances have been applied successfully against diseases whose treatment requires extremely high penicillin plasma concentrations.[9]

This report describes the clinical application of caronamide,[10] an orally effective compound of low toxicity and capable of producing a reversible inhibition of penicillin excretion by the renal tubules. The concept of action of this drug has been presented by Beyer,[7b] who stated that iodopyrin injection and para-aminohippuric acid act on a "mass action" basis to saturate functionally the transport mechanism of the renal tubules and thus inhibit the elimination of penicillin. The effectiveness of caronamide, however, depends on a "substrate competition between penicillin, which is excreted by the tubules, and 4'-carboxyphenylmethanesulfonanilide, which is essentially refractory to excretion by that transport mechanism."[7b]

The extensive laboratory investigation of the physiologic,[11] pharmacologic,[12] toxicologic[13] and bacteriologic[14] properties of caronamide justified clinical investigation.

ORAL ADMINISTRATION OF PENICILLIN AND CARONAMIDE

Six afebrile patients without apparent renal, cardiac or hepatic disease were studied for a period of six days. During the first forty-eight hours (the control period) penicillin alone was administered every four hours; during the second forty-eight hours (the drug-treatment period) both penicillin and caronamide were given together every four hours, and, finally, during the third period of forty-eight hours (the postdrug control period) penicillin only was administered every four hours. Thus each patient was observed during two control periods and one treatment period, each phase of the experiment being sufficiently long to permit equilibration of both penicillin and caronamide in the body tissues. Blood specimens for penicillin assay[15] were drawn throughout the night and day and were timed so that the composite data would provide information concerning the plasma concentrations one, two, three and four hours after the administration of caronamide and/or penicillin. The times for drawing samples were the same during the three phases of the experiment. Forty-two penicillin assays were performed on blood specimens from 1 patient, and thirty-four were done on blood samples from each of the other 5 patients.

All 6 patients were given orally 100,000 units of penicillin at four hour intervals. The same lot of crystalline sodium penicillin G was used throughout, and the content of a vial containing 100,000 units was dissolved in 10 or 15 cc. of tap water immediately before

TABLE 1.—*Oral Penicillin and Oral Caronamide* *

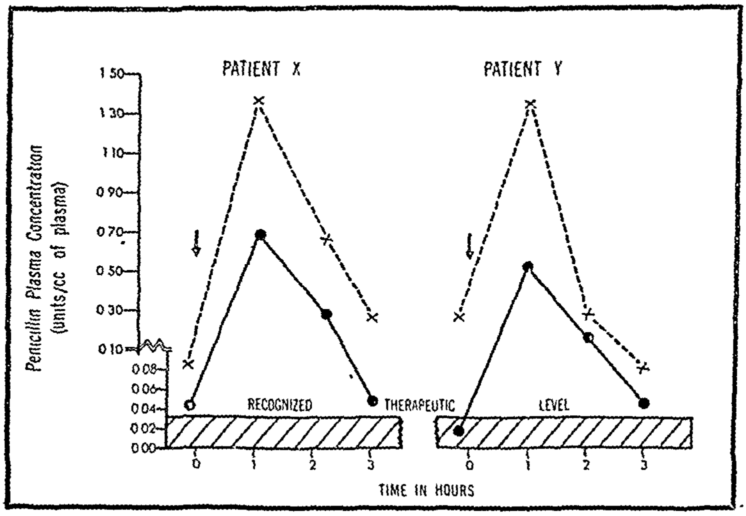
administration. All medicaments were given by or in the presence of one of us. The hospital routine was not altered in any way during this study; fluids were taken freely, diet was unrestricted and no antacids were used. No measures were employed to enhance penicillin levels other than the administration of caronamide.

Of the 6 patients studied, each for a period of six consecutive days, 2 showed remarkable increases in their penicillin plasma concentrations during the period of administration of 2 Gm. of caronamide in tablet form every four hours; 3 patients showed significantly higher levels when this drug was administered, and 1 patient failed to demonstrate any increase in penicillin plasma concentration when the caronamide was administered concomitantly with the antibiotic. This same patient showed but a single penicillin level above 0.02 unit per cubic centimeter during the two control periods when penicillin was administered alone.

Penicillin plasma concentrations obtained during both control periods have been averaged and compared to similar values obtained during the forty-eight hour period when penicillin and caronamide were administered together. It will be observed, from inspection of table 1, that the average penicillin plasma concentrations during the period of administration of the new compound were from 2.4 to 7.1 times (average 4.2) greater than those obtained when penicillin alone was administered.



Two patients studied on consecutive days, each patient serving as his own control It will be noted that plasma concentrations below 0.10 unit per cubic centimeter are presented on a magnified scale The solid line indicates the control phase (predrug) in which 50,000 units of penicillin were given intramuscularly every three hours. The broken line indicates the drug phase, in which 50,000 units of penicillin were given intramuscularly and 1.5 Gm of caronamide were given orally every three hours The arrow indicates the injection of 50,000 units of penicillin

It would appear, therefore, that 2 Gm. of caronamide administered orally every four hours enhances from two to seven times the penicillin blood levels achieved by the oral administration of 100,000 units of crystalline sodium penicillin G in aqueous solution. Values obtained during the postdrug control period compare closely with those in the control period. This observation rules out the possibility that the elevation of levels during the treatment period was merely the result of continued penicillin therapy. The comparable values in the preliminary and postdrug control periods further indicate the prompt recovery of the penicillin transport mechanism. A slight tendency for elevation of the values in the postdrug-control period probably reflects some delay in the elimination of caronamide.

INTRAMUSCULAR PENICILLIN AND ORAL CARONAMIDE

The first 2 patients studied were two young women (X, Y) receiving routine antisyphilitic therapy (50,000 units of penicillin every three hours). Crystalline sodium penicillin G was substituted for that being used routinely, and during a twenty-four hour control period 50,000 units in 2 cc. of sterile isotonic sodium chloride solution were given every three hours. During a second twenty-four hour period the same dose of intramuscular penicillin and 1.5 Gm. of oral caronamide were given every three hours. A penicillin dose response curve was established each day by assays on blood taken immediately before and then one, two and three hours after an injection of 50,000 units of penicillin. The accompanying illustration shows graphically the enhancement of penicillin levels by the oral administration of caronamide; the increases were striking and were of the order of from twofold to fivefold.

With this preliminary information obtained from only 2 patients it was believed justifiable, nevertheless, to regard control and treatment periods of twenty-four hours each as ample to permit equilibration of both penicillin and caronamide. To favor distribution of both agents in the body fluids, however, a priming dose of penicillin (100,000 units) was given at the beginning of the initial control period and a priming dose of caronamide (3 Gm.) at the beginning of the treatment period. For the sake of uniformity and comparison with the work done with oral penicillin, the intervals between medication were maintained at four hours and specimens of blood for penicillin assay were obtained at varying times after individual doses of penicillin.

Two patients (V, W) were given 50,000 units of penicillin every four hours during the preliminary and postdrug control periods; during the treatment period 50,000 units of penicillin plus 2 Gm. of caronamide were given every four hours. The penicillin assay values were averaged, and these data are presented in table 2 A. It is noted that the increase of penicillin blood levels of patients under treatment with caronamide were from 2.9 to 7.3 (average 5.17) times. The magnitude of enhancement is comparable to that obtained in the experiment with oral penicillin.

A single patient (Z) was given 2 Gm. of caronamide every four hours, and 100,000 units of penicillin were administered intramuscularly every four hours. From the assay values (table 3 A) it is apparent that caronamide exerted a favorable effect by increasing twofold to threefold the penicillin plasma concentrations observed in the control periods. It is interesting to note that the concentrations of the drug in the plasma after the administration of 100,000 units of penicillin to patient Z are not so high as those seen in patients V and W following 50,000 units of penicillin and caronamide.

Measurable increases of plasma concentrations were obtained in 5 patients (X, Y, U, W, Z) when 1.5 and 2 Gm. of caronamide were given every three and four hours, respectively. To determine whether smaller and more frequent doses were more or less effective 1 Gm. of caronamide was given every two hours to three patients. Two of these patients (T, U) received intramuscularly 50,000 units of penicillin every four hours during the control periods; during the treatment phase they received 50,000 units of penicillin every four hours plus 1 Gm. of caronamide every two hours. The average data (table 2 B) show a slight enhancing effect at the end of two, three and four hours, but not to the degree found when 2 Gm. of the compound was administered every four hours. A single patient (S) given 1 Gm. of caronamide every two hours showed only a slight effect of the drug on penicillin plasma concentrations (table 3 B).

EFFECT OF ORAL CARONAMIDE ON PENICILLIN IN BEESWAX AND OIL

Since the suspension of penicillin in beeswax and oil slows the rate of absorption of penicillin from the site of injection, it was of interest to determine whether or not the oral administration of caronamide would prolong or elevate penicillin plasma concentration following the single injection of penicillin in beeswax and oil (Romansky).

Three patients were studied. After the injection of 300,000 units of penicillin in beeswax and oil, penicillin assays were done on the plasma obtained at four hour intervals for forty-eight hours. A twenty-four hour period was allowed to elapse in order to exhaust whatever reservoir of penicillin might remain, and the same patients then were given a second injection of 300,000 units of penicillin in beeswax and oil and 2 Gm. of caronamide every four hours thereafter. Samples of blood were drawn at four hour intervals for seventy-two hours and were assayed for penicillin. This study failed to show any enhancing effect on the penicillin plasma levels, but it is believed that specimens of blood for assay were drawn at a time when the enhancing effect on blood levels probably was minimal. It has since been observed that the larger portion of an individual dose of caronamide is excreted within four hours, and it was four hours after administration of a dose of caronamide that specimens of blood for assay were obtained. Several additional patients have been studied. Specimens for assay were drawn at more favorable times with reference to the caronamide doses, and evidence has been obtained that caronamide does increase the penicillin plasma concentration after the administration of the antibiotic in beeswax and oil.

COMMENT

Throughout this investigation each patient was studied not only while receiving the drug but also in a preliminary control period and a postdrug control period, thus serving as his own control. This is essential particularly with reference to the oral administration of penicillin, since there is such a tremendous individual variation in the absorption of this antibiotic that patient to patient comparisons of penicillin plasma concentrations are of limited value. Despite the small number of patients studied during the course of this investigation, the fact that each individual served as his own control lends additional significance to the data presented.

Six patients given oral penicillin and oral caronamide showed increases of penicillin blood levels of from two to seven times those observed during control periods. Caronamide was given in doses of 2 Gm every four hours. Buffering agents were not administered with the penicillin, patients were permitted to take fluids freely, meals were given in accordance with hospital routine and no effort was made to enhance penicillin levels apart from the administration of caronamide.

Eight patients were given penicillin intramuscularly and caronamide orally. Five of these patients given either 1 5 Gm of caronamide every three hours (X, Y) or 2 Gm. every four hours (V, W, Z) showed enhancement of penicillin plasma levels of from two to seven times those observed during control periods. Three patients (S, T, U) given only 1 Gm of caronamide every two hours failed to show the same degree of enhancement of penicillin concentrations, but some effect of the drug was indicated, particularly toward the end of the penicillin dose-response curve.

The study of 3 patients to whom penicillin in beeswax and oil was administered provided equivocal results with respect to an effect of caronamide either in the enhancement or prolongation of the penicillin plasma concentrations. This probably was due to inappropriate timing for collection of blood samples for penicillin assay. A revised program of study of 6 additional patients indicates that caronamide does act to increase plasma concentrations when penicillin is administered in beeswax and oil.

These preliminary studies indicate that caronamide produces an elevation of penicillin plasma concentration when penicillin is administered either orally or intramuscularly. Caronamide probably influences favorably the plasma concentrations following the administration of penicillin in beeswax and oil. Further study is required to determine more closely the effect of caronamide on plasma concentrations following the administration of penicillin in beeswax and oil.

Although doses of 1.5 Gm. every three hours or 2 Gm. every four hours have shown an effect in enhancing penicillin plasma concentration, it is probable that larger doses of caronamide may be necessary. Although no optimal dosage schedule for administration of caronamide can be suggested from the results obtained in this preliminary clinical study, it would appear that from twofold to sevenfold enhancement of penicillin plasma concentration may be anticipated if from 1.5 to 2 Gm. of the drug are given concomitantly with penicillin every three and four hours, respectively.

No evidence of systemic toxicity was noted in this series of patients to whom this new compound was administered, but in the course of extended clinical experience with caronamide it is unlikely that some type of sensitivity or toxic manifestation will fail to be observed.

The work here reported establishes the fact that caronamide is effective in enhancing penicillin plasma concentrations. Caronamide is now being applied to the therapy of patients at the University of Pennsylvania Hospital and Philadelphia General Hospital. The results of this work will be the subject of a later communication.

CONCLUSION

A new drug, caronamide,[1] when administered orally elevates the penicillin plasma concentrations two to seven times following the oral and parenteral administration of penicillin. Caronamide gives promise of great therapeutic usefulness in the treatment of conditions which require high penicillin blood levels.

THE ELIGIBILITY OF SYPHILITIC PERSONS FOR LIFE INSURANCE

JOSEPH EARLE MOORE, M.D.
Baltimore
and
IRA LEO SCHAMBERG, M.D.
Philadelphia

The most recent communications on the mortality of syphilis are those of Schamberg[1] (a review of the literature to 1944), Heller and Bruyere,[2] Smith and Bruyere[3] and Rosahn.[4] These papers pave the way for a revision of policy regarding the insurability of syphilitic persons. It is the purpose of this paper to present such a policy.

The usual actuarial approach has been to compare the mortality rate in a group of known syphilitic patients (relatively small in number) with that in the population as a whole or in a select group of supposedly healthy persons. The data so obtained indicate that syphilis imposes an extra mortality hazard ranging from 138 to 188 per cent of expected mortality.[5]

All such studies to date are to an undeterminable extent inaccurate; and they are entirely inadequate to permit formation of a sound policy determining the insurability of syphilitic persons, for the following reasons:

1. The known syphilitic population is compared with a supposedly nonsyphilitic population, the latter of which, however, contains an unknown proportion of persons with actuarially unrecognized syphilis.

2. The published mortality data (in a syphilitic population) consider as a group persons with all stages and types of syphilitic infection, ranging from recently acquired (primary and secondary) syphilis, to various grave forms of late syphilis (e. g. cardiovascular and neurosyphilis). In the early cases the life expectancy is high, partly because most such patients are young at the time of infection and partly because the mortality from syphilis is concentrated within the period twenty or more years after infection. In the late cases the life expectancy is low, partly because these manifestations occur in older age groups and partly because of the inherent and inevitable mortality from syphilis itself (as in aneurysm).

3. The exact mortality due primarily or even secondarily to syphilis is not determinable from the causes of death provided on death certificates. There is reason to believe that in a syphilitic population the assigned cause of death may be in error by as much as 50 per cent, partly through inadvertence (the physician's inability to recognize the extent to which syphilis contributes directly or indirectly to death) and partly through intent (deliberate omission of syphilis as a primary or secondary cause of death in order to protect the patient, even post mortem, from disclosure of a "social disgrace").

4. Consideration is not given to the weighting of syphilis mortality figures by the fact that syphilis is primarily a disease of those in lower socioeconomic groups, which are subject to increased mortality risk from many other diseases and conditions (such as acute infections, tuberculosis and industrial hazards) and which are therefore not directly comparable to the population as a whole.

5. Consideration is not given to the adequacy of present day treatment methods. Such actuarial data as are available with respect to treatment relate to the prearsenical era (prior to 1910) or to the early days of metal chemotherapy (1910 to 1925). Moreover, the data do not relate treatment to the stage of syphilitic infection for which it was given.

It must be concluded, therefore, that actuarial studies of the mortality of syphilis so far made are incomplete, inaccurate and unsuitable for the determination of a policy in regard to the insurability of syphilitic persons. Further studies are urgently required, the character and scope of which should be determined by a conference group of clinicians and actuarial experts.

It is essential to point out, however, that studies of the mortality of syphilis as related to the adequacy of treatment will be, within the foreseeable future, *always* a generation out of date. The concept of what constitutes adequate treatment has been a constantly changing one since 1909, with the successive introduction of arsenic, fever, bismuth and now penicillin therapy. *With* the rapidly advancing and changing current progress in the chemistry and pharmacology of penicillin, it is reasonable to anticipate that the antibiotic therapy of syphilis is only in its infancy and that a few years hence penicillin may be abandoned in favor of a still more powerful agent. Since syphilis provides, to paraphrase Theobald Smith, the exquisite example of chronicity among infections, the effect on mortality of any

Suggestions as to Insurability of Syphilitic Persons

Type of Syphilis	Acceptability for Insurance after Average Adequate Treatment (See Next Column) Given during This Stage of Infection and after Probationary Period, If Any, Suggested in Column 4. (If "Accept," This Indicates as Standard Risk Unless Specified Substandard, in Which Case Percentage Increased Risk Is Suggested) Disability Insurance	Life Insurance	Average Adequate Treatment by 1947 Standards	Probationary Period Required After Treatment and Before Insurance Is Granted
Acquired				
Primary, early secondary, relapsing secondary or early latent (infection less than 2 yrs. duration) remaining seronegative for 2 or more yrs. after treatment	Accept	Accept	Penicillin 1.2 million or more U. given in 4 to 15 days; or 1,200 mg. or more oxophenarsine HCl, + 12 or more injections insoluble Bi; or equivalent	2 years
Primary, early secondary, relapsing secondary or early latent (infection less than 2 yrs. duration) remaining seropositive for 2 yrs. or more after treatment	Accept after retreatment for late latent syphilis	Accept after retreatment for late latent syphilis	As for late latent syphilis	*None required after suggested retreatment*
Late latent (infection more than 2 yrs. duration)	Accept regardless of serologic outcome after treatment given during late latency	Accept regardless of serologic outcome after treatment given during late latency	Penicillin 1.2 million or more U. given in 4 to 15 days; or metal chemotherapy *including 40 or* more injections arsenic and 16 or more Bi given within 6 to 12 mos.; or equivalent	None
Benign late (tertiary mucocutaneous, osseous or ocular [except optic atrophy])	Reject	Accept as 10 to 50% substandard risk, depending on interval between treatment and date of insurance application (mortality risk diminishes with passage of time)	Penicillin 2.4 *million or more U.* given in 7-21 days; or metal chemotherapy as for late latent syphilis	*None*
Benign late visceral (hepatic, gastric)	Reject	Reject		
Cardiovascular (aortitis, aortic insufficiency, aneurysm, coronary ostial stenosis)	Reject	Reject		
Neurosyphilis				
Asymptomatic; C. S. F. before treatment of indicated group *				
Group I	Accept after indicated treatment and probation	Accept after indicated treatment and probation	Penicillin 4 million or more U. in 8 to 15 days	2 yrs. during which C. S. F. must have been entirely normal on 2 successive occasions after treatment
Group II	Accept after indicated treatment and probation	Accept after indicated treatment and probation	Penicillin 6 million or more U. in 8 to 21 days	5 yrs. during which C. S. F. must have been entirely normal on 3 successive occasions
Group III	Reject	Reject		
Acute syphilitic meningitis	Reject	Accept as 10 to 15% substandard risk, depending on interval between treatment and date of insurance application (mortality risk diminishes with passage of time)	Penicillin 6 million or more U. in 8 to 21 days	5 yrs. during which patient remains clinically normal and C. S. F. entirely normal on 8 successive occasions
All other types (paresis, tabes, diffuse meningovascular neurosyphilis etc.)	Reject	Reject		
Congenital				
Early infantile (treated during this period, remaining seronegative, and with application for insurance in adolescence or adult life)	Accept	Accept	Metal chemotherapy 6 to 12 mos.; or penicillin 40,000 + U./Kg. in 8 to 15 days	2 yrs. or more after treatment
Early infantile (treated during this period but seropositive at time of insurance application in adolescence or adult life)	Reject (risk of interstitial keratitis or nerve deafness)	Accept after retreatment	Retreatment as for late latent acquired syphilis	None after retreatment
Latent (with or without stigmas; diagnosis based on serologic tests for syphilis)	Reject (see above)	Accept	As for late latent acquired syphilis	None after treatment
Interstitial keratitis	Reject	Accept	Penicillin 2.4 or more million U.; metal chemotherapy as for late latent acquired syphilis; either of these with or without fever therapy	None after treatment
Nerve deafness	Reject	Accept	As for interstitial keratitis	None after treatment
Benign late (mucocutaneous, osseous, ocular [except optic atrophy])	Reject	Accept as for acquired benign late syphilis	As for acquired benign late syphilis	None after treatment
Visceral (hepatic, gastric etc.)	Reject	Reject		
Neurosyphilis, all types	Reject	Reject		

---

* See standard textbooks for description of cerebrospinal fluid (C. S. F.) groups in asymptomatic neurosyphilis.

B. When this investigation is completed there should be available, for the first time, an adequate statistical basis for determining the most effective method of treating syphilis. But this will be a matter of time. In the meanwhile and because experience with Veterans Administration hospitals indicates the desirability of improving and standardizing therapeutic procedures, the present technical bulletin is being published. It cannot and does not pretend to be the final word on the subject. It does, in our judgment, represent the best current thought on the subject.

C. This bulletin will deal with the management of syphilis other than neurosyphilis. The management of neurosyphilis is dealt with in another bulletin.[3] Physicians responsible for the care of patients with syphilis in Veterans Administration hospitals will be expected to follow the procedures outlined in these bulletins and to supplement the information which they provide by reference to such standard textbooks as those by Moore and Stokes.

2. *Classification of Cases.*—A. The following diagnostic classification will be used for the purposes of treatment:

1. Syphilis, primary: (*a*) seronegative; (*b*) seropositive.
2. Syphilis, secondary: (*a*) syphilis, secondary; (*b*) syphilis, secondary, relapsing (state type of relapse).
3. Syphilis, latent, early (less than four years since infection).
4. Syphilis, latent, late (four or more years since infection).
5. Syphilis, tertiary, mucocutaneous.
6. Syphilis, tertiary, osseous.
7. Syphilis, tertiary, ocular (except optic atrophy).
8. Syphilis, tertiary, visceral (except cardiovascular).
9. Syphilis, tertiary, cardiovascular, aneurysm (state location of saccular aneurysm).
10. Syphilis, tertiary, cardiovascular, aortic regurgitation.
11. Syphilis, tertiary, cardiovascular, aortitis (uncomplicated).
12. Syphilis, tertiary, neurosyphilis (the diagnostic classification of neurosyphilis is described in another bulletin.[3])
13. Syphilis, type undetermined.
14. Syphilis, congenital (include all manifestations).
15. Nonsyphilitic, biologic false positive serologic tests for syphilis.

B. In cases with significant involvement of more than one system (e. g., the cardiovascular and the central nervous), all diagnoses will be entered.

3. *Diagnosis.*—A. Antisyphilitic treatment will not be started until the diagnosis of syphilis is definitely established. The demonstration of Treponema pallidum by dark field examination is a positive indication for the *immediate institution of treatment.* The presence of a positive serologic test for syphilis in the absence of confirmatory clinical signs or a definite history of syphilis, is not necessarily proof of infection, except as described in the succeeding paragraphs. Variations in laboratory technic, clerical errors and biologic false reactions may each result in the reporting of positive serologic tests in the absence of syphilis. A biologic false positive serologic test for syphilis is particularly likely to occur after malaria, recent smallpox vaccination or other immunizing inoculations, acute infectious diseases, fevers, infectious mononucleosis and certain other conditions. A series of repeated quantitative serologic tests for syphilis (titered for units of reagin) may be helpful in differentiating true syphilitic from biologic false positive reactions. In early syphilis, especially, the titer tends to rise or remain high, while in false positive readings the titer tends to decline spontaneously until a negative reaction is obtained. In doubtful cases observation over a period of weeks or even months may be required to reach a final decision.

B. The Kahn and Wassermann tests are the standard serologic tests for syphilis in the Veterans Administration at the present time. A quantitative Kahn test should be performed wherever feasible, especially in the post-treatment observation of patients with early syphilis and in the differentiation of syphilitic and false positive serologic reactions. The examination of the spinal fluid will include a cell count, a quantitative test for total protein, a complement fixation test (with 1.0, 0.5, 0.25 and 0.1 cc. of spinal fluid) and a colloidal test (gold, benzoin or mastic).

C. The basic criteria for the diagnosis of the various phases of syphilis are the following:

1. (*a*) Syphilis, primary, seronegative. T. pallidum must be demonstrated by dark field examination of the chancre. The initial serologic test for syphilis and a second test performed on the fourth to sixth day of treatment must both be negative. If the repeat test is positive, the case must be considered and treated as one of seropositive primary syphilis.

(*b*) Syphilis, primary, seropositive. T. pallidum are demonstrated by dark field examination of the chancre, and the initial serologic test for syphilis is doubtful or positive; or, if the initial test is negative, it will have become positive during treatment. In cases where repeated dark field examinations are negative (lymph node aspiration for treponemes may be performed), the diagnosis rests on the presence of repeatedly positive serologic tests, especially with a rising titer of the quantitative test, or on a change of the serologic tests from negative to repeatedly positive.

2. (*a*) Syphilis, secondary. There are one or more clinical signs of secondary syphilis (generalized eruption, mucous patches, condylomas, generalized lymph node enlargement, "moth-eaten" alopecia, laryngitis and periostitis), and the serologic test for syphilis is repeatedly positive. Efforts should be made to demonstrate T. pallidum by dark field examination of skin or mucosal lesions.

(*b*) Syphilis, secondary, relapsing. The diagnosis depends on the appearance of some manifestation of relapse following completion of treatment or during the course of treatment. The type of relapse may be clinical (infectious, with mucosal and/or cutaneous lesions, neurologic, ocular, osseous or visceral) or serologic. Serologic relapses are more fully described in the section of this bulletin devoted to definition of treatment failures.

3 and 4. Syphilis, latent. The serologic test for syphilis is repeatedly positive, there are no clinical manifestations of the disease, and the spinal fluid is normal. Thorough study must be made to eliminate cardiovascular syphilis, and the possibility of biologic false positive serologic tests should be excluded. If the duration of the infection is known to be less than four years, the case is diagnosed as early latent. If it is of four or more years' duration, it is diagnosed as late latent. When the duration of infection is unknown, it is customary to classify those patients who have not yet attained their twenty-sixth birthday as early *latent.*

5. Syphilis, tertiary, mucocutaneous. There are gummatous, ulcerative or nonulcerative lesions of the skin and/or mucous membranes, and the serologic test for syphilis is repeatedly positive.

6. Syphilis, tertiary, osseous. There are late bone or joint lesions attributable to syphilis, and the serologic test is repeatedly positive. The pathologic process may be osteomyelitis, periostitis or arthritis.

7. Syphilis, tertiary, ocular. There are eye lesions attributable to syphilis, and the serologic test is repeatedly positive. The pathologic process may be iritis, uveitis, keratoiditis, keratitis or choroiditis.

---

3. The Medical Management of Neurosyphilis, Veterans Administration Technical Bulletin (TB 10-26), March 27, 1947.

8. Syphilis, tertiary, visceral. There is a visceral lesion attributable to syphilis, and the serologic test is repeatedly positive. The lesion may be a hepatitis, hepatic cirrhosis, gumma of the stomach or some other condition not cardiovascular.

9. Syphilis, tertiary, cardiovascular aneurysm. There is a saccular aneurysm usually of the aorta, and the serologic test is repeatedly positive.

10. Syphilis, tertiary, cardiovascular, aortic regurgitation. There is an insufficiency of the aortic valve, and a repeatedly positive serologic test for syphilis.

11. Syphilis, tertiary, cardiovascular, aortitis (uncomplicated). There are symptoms and physical signs and/or roentgen changes indicative of aortitis and a repeatedly positive serologic test for syphilis.

12. Syphilis, tertiary, neurosyphilis. The criteria for the diagnosis of neurosyphilis is presented in another bulletin.[3]

13. Syphilis, type undetermined. This diagnosis is reserved for cases of apparently latent syphilis in which complete study, particularly examination of the spinal fluid, has not been possible.

14. Syphilis, congenital. There are stigmas of congenital syphilis or active physical signs or there is a definite history of syphilis in infancy or childhood, and the serologic test for syphilis is repeatedly positive. The active lesion most frequently encountered is interstitial keratitis.

15. Nonsyphilitic, biologic false positive serologic tests for syphilis. This diagnosis will be used in cases where the serologic test is positive but where there is no history, clinical evidence, or other laboratory findings permitting a diagnosis of syphilis. In these cases, the suggested diagnosis will be used until a positive diagnosis of syphilis can be made.

4. *Treatment Schedules.*—The only drugs authorized for use by Veterans Administration hospitals in the treatment of syphilis are penicillin, oxophenarsine hydrochloride (arsenoxide [mapharsen]), and bismuth subsalicylate in oil. Neoarsphenamine, arsphenamine and bismuth arsphenamine sulfonate ("bismarsen") will not be used. Penicillin should be administered in aqueous or normal saline solution, by intramuscular injection into the upper outer quadrant of the buttocks, or deltoids, using the right and left alternately. The penicillin solution should be prepared freshly, at least once a day, and should be stored in a refrigerator when not in use.

Schedule A consists of a total of 3,000,000 units of penicillin, administered in sixty individual doses of 50,000 units at three hour intervals, day and night, over a period of 7½ days.

Schedule B consists of a total of 6,000,000 units of penicillin, administered in one hundred and twenty individual doses of 50,000 units at three hour intervals, day and night, over a period of fifteen days.[4]

Schedule C is identical with schedule B so far as dosage and method of administration of penicillin is concerned. However, in addition to the penicillin, six doses of 60 mg. of oxophenarsine hydrochloride are also given, three during the first week of treatment and three during the second week. The initial dose of this drug should not be given on the same day that penicillin is started. For convenience, the oxophenarsine hydrochloride may be given on Monday, Wednesday and Friday or on Tuesday, Thursday and Saturday of each week.

Schedule D consists of forty injections of oxophenarsine hydrochloride and sixteen of bismuth subsalicylate in oil given over a period of twenty-six weeks as follows: weeks 1 to 5, oxophenarsine hydrochloride twice weekly and bismuth once weekly; 6 to 10, oxophenarsine hydrochloride twice weekly; 11 to 16, a bismuth compound once weekly; 17 to 21, oxophenarsine hydrochloride twice weekly, and 22 to 26, oxophenarsine hydrochloride twice weekly and a bismuth preparation once weekly.

Dosage: Oxophenarsine hydrochloride: average dose is 60 mg., minimum 50 mg. and maximum 70 mg., the variations being made to parallel variations in body weight.

Bismuth subsalicylate in oil: average dose is 0.2 Gm. of bismuth subsalicylate, the amount contained in 1½ cc. of the oily suspension.

Application of the Treatment Schedules.—The schedules in the accompanying table will satisfy the treatment requirements of the majority of patients suffering from the particular phase of syphilis for which they are recommended. There will be a small number of cases in which clinical response may be unsatisfactory, and in these the physician is justified in giving supplemental therapy (e. g., additional penicillin, or oxophenarsine hydrochloride and bismuth subsalicylate).

Recommended Treatment Schedule

Stage of Syphilis	Schedule
Primary, seronegative	A
Primary, seropositive	B
Secondary	C
Secondary, relapsing (except neurologic)	C and D
Latent (early)	A
Latent (late)	B
Tertiary, mucocutaneous	B
Tertiary, osseous	B
Tertiary, ocular	B
Tertiary, visceral	B
Tertiary, cardiovascular (all types)	B[4]
Tertiary, neurosyphilis	See bulletin[3]
Type undetermined	B
Congenital	B

6. *Toxic Reactions Due to Treatment.*—All precautions will be taken to assure that the drugs employed have not deteriorated, that they are properly prepared for injection and correctly administered. Prior to each injection, especially in the case of oxophenarsine hydrochloride, inquiry should be made as to the occurrence of any reaction following the previous injection. It is best to discontinue treatment with oxophenarsine hydrochloride in cases where any evidence of the previous occurrence of a reaction exists and to obtain expert advice before resuming such therapy. However, in combined schedules using penicillin and oxophenarsine hydrochloride, the penicillin may be continued.

A. Oxophenarsine Hydrochloride: Ordinarily, minor reactions, such as nausea, vomiting, diarrhea and headache, call for a reduction of the dose of oxophenarsine hydrochloride or its abandonment if the reaction is severe and continuous. Serious reactions, such as erythema of the ninth day (Milan's reaction), drug fever, drug eruptions, jaundice, blood dyscrasias, thrombopenic purpura, agranulocytosis, aplastic anemia) and neurologic reactions (hemorrhagic encephalopathy, peripheral neuritis) demand immediate and permanent discontinuance of oxophenarsine hydrochloride and prompt, active treatment of the reaction. In the more severe systemic reactions the following treatment measures are of value: intravenous administration of 5 per cent dextrose solution; high protein, high carbohydrate, low fat diet; supplemental vitamins, especially thiamine chloride and B complex; blood transfusions; a course of penicillin in agranulocytosis and aplastic anemia to ward off bacterial infection. In the type of reactions which may be fatal (encephalopathy, jaundice, exfoliative dermatitis and blood dyscrasias) the prompt use of BAL (2,3-dimercaptopropanol, British antilewisite) may be life-saving. The technic for the employment of this agent is described in another bulletin.[5] The subsequent treatment of the syphilitic infection should be decided on with the advice of the appropriate consultant.

---

[4] To avoid possible dangerous therapeutic shock and paradox, treatment should not be initiated with the 50,000 unit dose; the patient should be given 5,000 units for three days (twenty-four doses) before the one hundred and twenty doses of 50,000 units are begun. However, where desired, the patient may be given bismuth subsalicylate in oil once weekly for four weeks prior to penicillin, in which case the 50,000 unit dose may be employed from the outset.

B. Bismuth Subsalicylate in Oil: Care in the administration of the drug will minimize the incidence of local reactions such as induration, abscess and arterial and venous embolism. Other reactions are exceedingly rare, except for stomatitis, the incidence of which can be reduced by careful attention to oral hygiene. When stomatitis occurs, bismuth should be discontinued and appropriate treatment of the oral cavity instituted.

C. Penicillin: The most common reaction is the Herxheimer (therapeutic shock), usually manifested by fever during the first twenty-four hours of treatment, and often accompanied by aggravation of the syphilitic lesions and such symptoms as headache, malaise, chilly sensations and weakness. This reaction may be considered a favorable one since it is ascribed to the abrupt, massive destruction of treponemes in the syphilitic lesions and in the blood stream. It is most frequently observed in primary and secondary syphilis. The Herxheimer reaction is not an indication for interruption or discontinuance of penicillin therapy. It subsides spontaneously, usually within the first twenty-four to thirty-six hours, in spite of continued treatment, and requires only symptomatic medication such as codeine or acetylsalicylic acid. Other reactions, less frequently observed, are mild or moderate secondary fever, occurring toward the end of treatment and terminating shortly after cessation of treatment, urticaria and other minor skin eruptions, generalized pruritus without eruption, herpes labialis [illegible] mild gastrointestinal symptoms. [illegible] be considered sufficient cause for interruption of treatment, with the possible exception of urticaria when severe, or angioneurotic edema involving the upper part of the respiratory tract. Injections of epinephrine or oral administration of "benadryl" (diphenhydramine hydrochloride) capsules (50 mg. each) or "pyribenzamine" (tripelennamine hydrochloride) tablets (50 mg. each) four or five times daily at three to four hour intervals, may assist in controlling the urticaria or angioneurotic edema until penicillin treatment has been completed. At times, substitution of another commercial brand of penicillin may provide relief.

7. *Post-Treatment Observation.*—Patients not eligible for outpatient care by the Veterans Administration should be referred, after discharge from the hospital, to the most competent local agency or individual for observation. The hospital physician should impress on the patient that regular and prolonged observation is absolutely essential for a final determination of cure. This is especially vital in primary and secondary syphilis but should be accomplished in all cases, whenever, practicable.

A. Clinical and Serologic Follow-Up: All patients should have a physical examination for evidences of clinical relapse and serologic test for syphilis (preferably quantitative) at monthly intervals during the first twelve months after completion of the treatment course and at two month intervals during the second twelve month period. Thereafter, examinations at intervals of six months for a period of five years will suffice in cases which are progressing favorably.

B. Spinal Fluid Examination: In all cases of primary and secondary syphilis that pursue a favorable course, a complete examination of the spinal fluid will be made as soon as possible after the completion of six months of follow-up. In all cases in which a clinical or serologic relapse occurs, and this is especially true of primary and secondary syphilis, examination of the spinal fluid will be carried out immediately, regardless of the time interval after treatment. In other types of syphilis than early syphilis, except neurosyphilis,[3] the initial diagnostic spinal fluid examination need not be repeated unless some specific indication arises.

8. *Clinical and Serologic Post-Treatment Course of Cases Which Respond Favorably.*—A. Primary and Secondary Syphilis: (1) Clinical course: The rate of healing of primary and secondary lesions varies. Chancres of small size, mucous patches and macular eruptions are ordinarily healed by the time the penicillin course is completed. Large ulcerated chancres, deeply infiltrated papular eruptions and large condylomata lata may not heal completely for one to three weeks after penicillin treatment is concluded.

(2) Serologic course: The serologic test for syphilis does not become negative immediately after completion of the penicillin course, the reverse being frequently true. Thus, seronegative primary cases often become seropositive, and seropositive cases often show a high titer of the quantitative test, immediately after completion of penicillin therapy. The titer of the serologic test declines gradually in the post-treatment period, the negative phase being attained in a variable period of time. The majority of cases become negative between the second and the fourth post-treatment months, although earlier and later reversals occur. In general, the higher the initial titer of the quantitative serologic test for syphilis the longer the test will require to become negative. Since lesions almost invariably heal following penicillin therapy, even in eventually unfavorable cases, the serologic course must be regarded as the most sensitive index of the progress of the case.

(3) Critical relapse period: The critical period for relapse, both clinical and serologic, appears to lie between the third and ninth post-treatment months, although relapses have occasionally been observed at earlier and later periods.

B. Latent Syphilis: (1) Clinical course: Since these patients have no discoverable lesions, no observations as to healing can be made.

(2) Serologic course: The serologic curve may take the same course as that observed in primary and

---

[5] The Treatment of Poisoning by Arsenicals and Mercury with BAL, Veterans Administration Technical Bulletin (TB 10-9), May 20, 1946, para. 8.

secondary syphilis, especially in cases of extremely early latent syphilis which have recently passed from the secondary stage into the phase of latency. On the other hand, patients with latent syphilis of longer duration often exhibit serologic refractoriness, the serologic titer showing little or no tendency to decline, and they must eventually be classified as serum-fast. Such cases should not be retreated after having received the therapeutic course recommended in paragraph 5 herein, except in the event that there subsequently appears evidence of failure or progression as defined in paragraph 9 of this bulletin.

C. Tertiary Syphilis (Mucocutaneous, osseous, ocular and visceral): (1) Clinical course: Gummatous lesions usually heal rather promptly with penicillin, although extensive and deeply ulcerated lesions may not heal for several weeks after completion of the penicillin course. Similarly, osseous, ocular and visceral lesions may not respond completely for several weeks after completion of the course. The physician, with the advice of the appropriate specialist, must exercise judgment in deciding whether final response has been satisfactory or whether additional treatment is indicated.

(2) Serologic course: The pattern of serologic response is generally similar to that described for latent syphilis, a large proportion of the cases remaining serum-fast. Serologic response is, therefore, of little significance in determining outcome, the most important guide to success being the clinical course.

D. Tertiary, Cardiovascular (All Forms): (1) Clinical course: While treatment cannot be expected to reverse definitive pathologic changes in the cardiovascular system, it often results in considerable symptomatic improvement and may prolong life by stopping the progress of the lesion. The cardiologist should participate actively in the management of these patients.

(2) Serologic course: The response is similar to that described for latent syphilis, many cases remaining serum-fast. Clinical course is the important guide to progress and to the need for retreatment in these patients.

E. Tertiary Neurosyphilis (All Forms): The course is described in TB 10-26.[3]

F. Congenital: (1) Clinical course: Patients under the care of the Veterans Administration will be adults with congenital syphilis of long duration. When gummas are present they will respond as described in paragraph 8C (1). The response of interstitial keratitis is variable, seldom being rapid and complete, and adjuvant therapy with arsenic and bismuth compounds and hyperthermia may be necessary to produce a satisfactory outcome. The ophthalmologist should participate actively in the management of patients with interstitial keratitis.

(2) Serologic course: The serologic curve is similar to that described for latent syphilis, many cases remaining serum-fast.

9. *Definition of Treatment Failure.*—Great care should be exercised in the diagnosis of treatment failure, since patients may develop various intercurrent conditions of nonsyphilitic nature. Intercurrent infections, smallpox vaccination and other conditions may cause temporary reversal of the serologic test for syphilis from negative to weakly positive, or elevation of the titer of the quantitative serologic test (biologic false positive reaction). All forms of clinical relapse are generally preceded or accompanied by serologic relapse or by persistently high serologic titers. Treatment failures may be subdivided into the following categories:

A. Infectious Relapse: Mucous and/or cutaneous syphilitic lesions appear, particularly in the oropharynx and anogenital region. There may be lesions of the skin and mucous membranes or of either surface alone. Determined efforts should be made to demonstrate T. pallidum by dark field examination to make the diagnosis definite. If the dark field examinations are negative, repeated quantitative serologic tests for syphilis should be performed, which will reveal a progressively rising titer in the relapsing case or a persistently high titer without tendency to decline.

B. Serologic Relapse: Serologic relapse is manifested by a rising titer of the quantitative serologic values after the test has shown a previously falling trend, or by a reversal of the test from a negative state to a persistently positive state. The rise in titer or the change from negative to positive that often occurs during or soon after completion of penicillin treatment will not be construed as evidence of serologic relapse. When a serologic relapse is suspected, the patient should be thoroughly and frequently examined, for serologic relapse is usually accompanied or followed at a brief interval by infectious or some other form of clinical relapse. Since the titer of the quantitative serologic tests for syphilis may vary from time to time as a result of laboratory technic, it is not sufficient to accept minor fluctuations in the titer as evidence of serologic relapse. Serologic relapse should be diagnosed only when a series of consecutive tests, performed preferably in the same laboratory, show persistently increasing titers over a period of three to four weeks. In the event that a titered test cannot be performed, a change from a doubtful or negative reaction to a persistently positive reaction will be accepted as adequate evidence of serologic relapse.

C. Serum-Fastness: Serum-fastness in primary and secondary syphilis is manifested by a failure of the quantitative serologic tests for syphilis to show a marked decline within an arbitrary period of six months after completion of therapy. Minor fluctuations in the titer may be observed, and also a drop to a lower sustained level, but no consistent, gradual and maintained fall to negative occurs. This condition will be uncommon in primary and secondary syphilis but when it occurs should be managed as a treatment failure. It will be more common in latent, tertiary and congenital syphilis but will not be considered adequate reason for retreatment without clinical evidence of failure.

D. Neurologic Relapse (Neurorecurrence): The most common form of neurologic relapse is symptomatic neurosyphilis, manifested by an abnormal spinal fluid without other clinical evidence of disease. Neurologic relapse may also occur as acute syphilitic meningitis with headache, dizzy spells, fever and rigidity of the neck. In fulminant cases coma may supervene fairly rapidly. Less commonly, a neurologic relapse may appear as an isolated cranial nerve palsy or as paralysis of one or more extremities. Diagnosis should be confirmed by spinal fluid examination, and the neurologist should be consulted for diagnostic assistance.

E. Ocular Relapse: Ocular relapse may occur as iritis, usually unilateral, or optic neuritis or neuroretinitis, which may be unilateral or bilateral. The latter two conditions may be accompanied by headache, with blurring and progressive failure of vision. In these cases the ophthalmologist should be consulted for diagnostic assistance.

F. Osseous Relapse. Osseous relapse is manifested by severe pain, often nocturnal, in the long bones, most often the tibias, or by severe headache when the cranial bones are affected. Local tenderness over affected bones is often very acute. Roentgenograms may assist in the diagnosis.

G. Treatment-Resistance: Failure of the lesions to heal and the continued presence of living treponemes will be observed with extreme rarity in early syphilis after completion of penicillin therapy. The slower response of some large chancres and other early syphilitic lesions will not be construed as treatment-resistance, unless dark field examination reveals the continued presence of living treponemes. In such cases the possibility that the residual lesion is nonsyphilitic must be considered (e. g., the penile ulcer may have a chancroidal component, the generalized eruption may not be a secondary syphiloderm, or the condylomas may be acuminate [venereal warts]).

H. Visceral Relapse: Hepatitis with jaundice and other forms of visceral relapse have not thus far been recorded after penicillin therapy, but the physician should watch for their occurrence.

10. *Management of Treatment Failures.*—A. The management of neurologic relapse is discussed in another bulletin.[3]

B. All other forms of treatment failure will be treated by schedule C, followed by schedule D. If schedule D has not been completed prior to discharge from the hospital, the patient will be referred to the appropriate agency or individual for its completion.

C. Cases that fail to respond satisfactorily to retreatment by schedules C and D, as described in the preceding paragraph, require expert advice as to further management.

11. *Administrative Management.*—A. Personnel: It is recommended that the physician in each Veterans Administration hospital who is most interested and experienced in this field be assigned complete responsibility for the management of all patients with syphilis. He will generally be a member of the medical service, except in neuropsychiatric hospitals. The appropriate specialist, especially the neuropsychiatrist, ophthalmologist and internist, should be called on to cooperate with him in the management of patients having parenchymatous involvement.

B. Consultation: Expert advice, not available locally, may be required in the management of certain cases. The branch office should be called on to furnish consultative services under those circumstances.

Concentrated Antibodies.—Gamma globulin is that fraction of the plasma proteins which contains the immune bodies. Recent preparations of this material contain antibodies which are concentrated approximately twenty-five fold over the pooled plasma from which they are derived.—Berenberg, William: Gamma Globulin as a Prophylactic and Therapeutic Agent in Communicable Disease, *Milbank Memorial Fund Quarterly,* April 1947.

DIPHTHERIA MORTALITY IN LARGE CITIES IN THE UNITED STATES IN 1946

TWENTY-SECOND REPORT

The procedure followed in obtaining data for this report is described in the review of typhoid mortality for the same cities.[1] A communication was addressed to the health officer of each of the cities requesting the number of deaths from diphtheria both among residents and among nonresidents reported in 1946. Comment was also sought on any special outbreak of diphtheria or change in age incidence; also any special program to secure the protection of children against this disease. In calculating death rates the 1940 census figures were used. Footnotes indicate corrections in rates for those cities for which the Bureau of the Census has prepared official estimates for years subsequent to 1940.

The practice of charging all deaths, both among residents and among nonresidents, against the individual city has been continued, with the inclusion of appropriate symbols similar to those employed in previous years. Such symbols indicate those cities in which either (1) all diphtheria deaths were stated to be in nonresidents or (2) one third or more of such deaths were stated to be in nonresidents. Attention is directed to table 11, which lists thirty-one cities that record no diphtheria deaths among residents in 1946. In ten additional cities (Akron, Charlotte, Cincinnati, Flint, Memphis, New Haven, Portland, Providence, Springfield, Tacoma) it is stated that all diphtheria deaths in 1946 were among nonresidents. In addition to the twenty-seven cities (table 12) with no diphtheria and typhoid deaths in 1946, seven cities (Akron, Charlotte, Flint, Memphis, New Haven, Providence, Springfield) report no deaths among residents from either cause.

The fourteen New England cities (table 1) (population 2,579,152) not only have failed during the past six years to equal the low point of six deaths in 1940 (eleven in 1941, eleven in 1942, twelve in 1943, nine in 1944, eight in 1945) but had more than four times the number of deaths for the preceding year (thirty-six in 1946). The death rate for the group as a whole has increased from 0.23 in 1940 to 1.40 in 1946 (0.43 in 1941 and 1942; 0.47 in 1943; 0.35 in 1944; 0.31 in 1945) and these cities find themselves in sixth place, the death rate being higher only in the Mountain and Pacific group (1.70) and the South Atlantic cities (1.68). Although the increase in number of deaths is evident in several cities (Cambridge, Hartford, Lowell, Somerville, Worcester), the most striking increase occurred in Boston, where there were recorded twenty-two deaths, twelve among nonresidents. The health commissioner states that the increase in resident deaths is part of the "nationwide diphtheria increase without any unusual death rate." The fact remains that deaths among residents in Boston have increased from one each in 1942 and 1943 to two in 1944, three in 1945 and ten in 1946. It is further stated that the large number of deaths among nonresidents (twelve in

---

The preceding articles were published in The Journal Sept. 20, 1924, p. 918; April 25, 1925, p. 1269; April 3, 1926, p. 1005; April 30, 1927, p. 1396; May 19, 1928, p. 1621; May 25, 1929, p. 1759; June 7, 1930, p. 1838; May 23, 1931, p. 1768; May 7, 1932, p. 1644; May 20, 1933, p. 1595; May 26, 1934, p. 1758; June 15, 1935, p. 2182; June 13, 1936, p. 2060; June 26, 1937, p. 2200; Aug. 6, 1938, p. 524; May 20, 1939, p. 2043; May 11, 1940, p. 1875; Feb. 28, 1942, p. 714; Aug. 29, 1942, p. 1503; Aug. 14, 1943, p. 1079, and July 27, 1946, p. 1053.

[1] Typhoid in the Large Cities of the United States in 1946, J. A. M. A. **134**: 1086 (July 26) 1947.

1946) is due to the liberal policy with regard to hospitalizing cases from nearby communities Only five cities (Bridgeport, Fall River, Lynn, New Bedford, Waterbury) record no death (there were nine in 1945 and 1944, eight in 1943, nine in 1942). It is stated that in three cities (New Haven, Providence, Springfield) the one death was among nonresidents Of thirty-six deaths in this group of cities, seventeen were among nonresidents (twelve in Boston, two in Hartford, one each in New Haven, Providence and Springfield) It is stated that there has occurred no death from diphtheria in Lynn for ten years (a record equaled only by Elizabeth), none in Waterbury for eight years, none in Bridgeport for seven years Following a period of six years without a death, Worcester records two among residents New Haven reports no death among residents for eight years Lynn reports no diphtheria or typhoid death during the past ten years, Bridgeport none for five years, Fall River none for four years, Waterbury none for three years

¶ 1944 special census gives rate of 0.4 for 1946 and 0.5 for 1941 1945 for Norfolk and rate of 0.2 for 1945 for Washington
‡ 1946 special census gives rate of 0.5 for 1946 for Washington

The eighteen cities (population 13,129,185) in the Middle Atlantic states (table 2) continue to hold first place The group rate of 0.38 is nearly double that of 1945 (0.20) and significantly higher than that of 1944 (0.11), when these cities set an all time low for any group In 1944 there were but fifteen deaths, five among nonresidents In 1946 there were fifty deaths nine among nonresidents Thus the number and but two for diphtheria. For nine years South Bend has reported but one typhoid death (one among nonresidents in 1944) and but two for diphtheria. Chicago reports an increase from three deaths in 1945 to thirteen in 1946, all among residents (in 1943 there were fifty-three deaths). Detroit records a striking reduction in diphtheria deaths from twenty-one (sixteen among residents) in 1945 to four (two among residents) in 1946. Cincinnati for the first time reports no death among residents (three among nonresidents) Cleveland records but one death (there were six in 1945). The number of deaths in Columbus has decreased from twelve in 1945 to six in 1946 (there were none in 1941). Deaths in Indianapolis have decreased from eleven in 1945 (nine among residents) to eight in 1946 (four among residents). Milwaukee reports three deaths and Toledo two, all among residents.

The cities in the East South Central States (table 5) *(population 1,286,747) report* a considerable decrease in diphtheria deaths, both among residents and nonresidents. In 1946 in this group of cities there were thirteen deaths with nine among nonresidents (in 1945 there occurred forty-one deaths, twenty-five among nonresidents). In 1943 this group reported a low of eight deaths, only two of which were among residents. The group rate decreased from 3.18 in 1945 to 1.01 in 1946 (the low was 0.62 in 1943). In contrast to 1945, when this was the highest of all groups, in 1946 these cities are in third place. Two cities (Chattanooga, Nashville) appear on the honor roll (table 11) with no diphtheria deaths. Memphis records no death among residents for two years. Three other cities (Birmingham, Knoxville, Louisville) record one third or more deaths among nonresidents (one of two in Birmingham, four of six in Knoxville, two of three in Louisville). Chattanooga and Nashville also report no typhoid death in 1946, but the health officer of Chattanooga states that deaths among nonresidents are not coded.

The nine cities in the West North Central states (table 6) (population 2,716,484) after maintaining a fairly consistent rate for four years show a definitely higher rate (1.29 in 1946; 0.66 in 1945). The number of deaths has increased from eighteen (ten among residents) in 1945 to thirty-five (twenty-eight among residents) in 1946. The low point occurred in 1941 with a rate of 0.18 and five deaths (four among residents). Only two cities (Des Moines, Wichita) are on the 1946 honor roll (there were four in 1945). Wichita records no death from typhoid or diphtheria for four years, Des Moines none for three years.

1946*	93	0	0	0	3	60	30

* Charlotte, Gary and Sacramento omitted.

Following a period of ten years with only two diphtheria deaths, Duluth reports seven in 1946, four among residents. Of the nine deaths recorded during the period 1943-1946 only two have occurred among pre-school children or infants. The health officer is impressed with the relatively short duration of artificial protection. With no death among residents in 1945, St. Louis reports four such deaths in 1946. The health commissioner notes a definite increase in incidence of diphtheria. Minneapolis records nine deaths, seven among residents, in contrast to three, all among residents, in 1945 and no deaths in 1942. St. Paul reports three deaths and Omaha two, all among residents. In 1945 there were no deaths in these cities.

* Five cities (Jacksonville, Miami, Oklahoma City, South Bend and Utica) are omitted from this summary because data for the full period are not available.

† Data for Fort Worth lacking.

†† 1940 census figures used.

The eight cities of the West South Central states (table 7) (population 2,048,692) report twenty-seven deaths, eighteen among residents (there were fifty-one deaths in 1945, thirty-three among residents). This constitutes the lowest number of deaths for this group of cities, the previous low being thirty-four deaths in 1941 (rate 1.66). The group rate decreased from 2.48 in 1945 to 1.32 in 1946. Dallas and Fort Worth appear on the honor roll for the first time. In 1942 there were three deaths in Fort Worth and in 1944 three in Dallas, all among nonresidents. However, in 1946 these cities report no deaths among either nonresidents or residents. In New Orleans it is stated that of twelve deaths seven occurred among nonresidents. Two cities (there were four in 1945) report rates in excess of 2.0 (New Orleans, San Antonio). Houston reports five deaths, four among residents. San Antonio records seven deaths, six among residents. It is stated that the one death each in El Paso, Oklahoma City and Tulsa was among residents.

In 1940 Sacramento was added to the eleven cities included in the Mountain and Pacific group (table 8). The figures for this city have been omitted in the tables for group comparison. The original cities (population 4,186,039) report substantially the same number of deaths as in 1942 and 1945 (seventy-one in 1946, seventy-three in 1942 and 1945). This is larger than the number of deaths (thirty-nine) in 1941. The rate has increased from 0.93 in 1941 to 1.70 in 1946, and this is the highest group rate for the latter year (table 16). Of the seventy-one deaths in 1946 fifty-two were among residents (forty-seven among seventy-three in 1945). Long Beach, with no typhoid or diphtheria death in 1946, is the only city on the honor roll. It is stated that the two diphtheria deaths in Portland and the one in Tacoma were among nonresidents. Two other cities (Oakland, San Diego) record one third or more deaths among nonresidents (two of six in Oakland, one of three in San Diego). Five cities (Denver, Oakland, Sacramento, San Francisco, Seattle) report rates in excess of 2.0. Adjusted to a 1945 census, the San Francisco rate is 1.5 (fifteen deaths, eleven among residents). Adjusted to a 1946 census, the Oakland rate is 1.5 (six deaths, four among residents). Denver reports seven deaths, all among residents. Los Angeles records twenty-seven deaths, twenty among residents. Sacramento reports four deaths, three among residents.

Of the entire ninety-three cities there was none (one in 1945) with a rate in excess of 10.0 and three (Evansville, Duluth, Knoxville) with rates in excess of 5.0 (table 14). The number of cities with no deaths from diphtheria has decreased from thirty-six in 1945 to thirty in 1946. The largest number (forty) of cities found in this group was in 1940. The number of cities with rates below 5.0 is sixty (fifty-four in 1945). For the eighty-eight cities (table 15) for which data are available since 1923 there occurred three hundred and twenty-nine deaths from diphtheria in 1946 (more than for any single year since 1938). The rate, however, for this group of cities remains for the eighth consecutive year less than 1.0. The rate for the ninety-three cities (0.88) is the same as that for the eighty-eight

TABLE 16.—*Total Diphtheria Death Rates per Hundred Thousand of Population for Ninety-Three Cities According to Geographic Divisions*

	Population *	Diphtheria Deaths		Diphtheria Death Rates			
		1946	1945	1946	1941-1945	1935-1939	1930-1934

* 1940 census figures used.

† One third or more of the reported diphtheria deaths were stated to be in nonresidents.

cities. The actual number of deaths has increased by one hundred and twenty-one over the low of 1941. The most impressive increase has occurred in the New England cities, while the most definite decrease is reported for the East South Central group. The hospitalization of cases from surrounding suburban and rural areas continues to influence the picture. There is a slight tendency for diphtheria to become relatively more prevalent among the higher age groups. Infants and preschool children should receive their protective treatments, and protective boosters should be given at time of school admission and later in life when conditions indicate that it is desirable. Diphtheria can be eliminated only if administrative and educational programs are adjusted to changing circumstances.

Clinical Notes, Suggestions and New Instruments

SUCCESSFUL DESENSITIZATION IN PENICILLIN SENSITIVITY

SAMUEL M. PECK, M.D.
and
SHEPPARD SIEGAL, M.D.
With the assistance of
ROSE BERGAMINI, B.A.
New York

Penicillin is finding increasingly wide use in present day medical practice. The clinical indications for its use were at first almost exclusively imperative and urgent. However, at present it is used in preference to other available forms of treatment in many mild infections, and its administration has become an almost routine postoperative precaution. As a result, the reported incidence of reaction to penicillin has increased. These reactions are for the most part allergic, and in many instances they are of such severity as to preclude or limit further use of the drug.

The case reported here illustrates the clinical problem which arises when resumption of penicillin therapy becomes necessary or a person who previously exhibited such an allergic reaction.

The reactions to penicillin in our clinical material have fallen into four groups:

Group 1: Reactions similar to those seen in other cases of drug sensitization and often characteristic of serum sickness. Closely allied to this group are the various toxic erythemas and the severe local reactions after the administration of penicillin in beeswax and peanut oil.

Group 2: Reactions following local application of the drug, falling into the category of allergic contact dermatitis.

Group 3: The erythematovesicular eruptions which often are initiated on, and may remain limited to, the hands, feet and groin, at the sites of previous fungous infection.[1] Further administration of the drug may cause dissemination of the lesions. This type of reaction can be explained by the fact that the fungi commonly responsible for dermatomycosis in these areas are capable of producing penicillin.[2] It is probable that these patients have become sensitized to penicillin in this manner.

Group 4: Febrile reactions, usually unaccompanied by cutaneous manifestations, following aerosol inhalation or bronchial instillation of penicillin. This form of reaction may ultimately be classified with group 1.

In our experience, immediate reactions to penicillin skin tests have been negative. The presence of a delayed positive test of the forty-eight hour type has usually been of clinical significance.

REPORT OF CASE

A white man aged 63, with acute respiratory distress of two days' duration, was readmitted to the nose and throat service of the Mount Sinai Hospital on July 29, 1946. He had been hospitalized in 1941 for pachydermia laryngis, which had been treated by tracheotomy and radiotherapy.

Examination revealed espiratory stridor with decided supraclavicular and infraclavicular retraction. Direct laryngoscopic examination revealed intense edema and redness of the arytenoids, aryepiglottic folds and epiglottis. The vocal cords could not be visualized. The remainder of the physical examination was irrelevant. Results of examination of the blood and urinalysis were within normal limits. Roentgen examination of the neck was negative.

An emergency tracheotomy was performed on admission. Penicillin therapy was immediately started with an initial dose of 100,000 units followed by 30,000 units every three hours intramuscularly. The total daily dosage of penicillin was 220,000 units the first day and 240,000 units the second and third days. On the fourth day only three injections totaling 90,000 units could be given, because the patient developed an acute erythematovesicular eruption on the hands, feet and groin. The eruption rapidly spread to involve the entire body. The skin on the body showed a scarlatiniform type of eruption with edema of the face. There were some vesicles on the forearms. The eruption gradually subsided, but desquamation of the hands and feet was still evident one month later. There was no previous history of penicillin therapy, nor could a personal or a family history of allergic disease be elicited.

Following tracheotomy, laryngoscopic examination disclosed the presence of a mass involving the right arytenoid and ventricle. On biopsy this proved to be an infiltrating, cornifying squamous cell carcinoma. Further radiation therapy was considered inadvisable, and laryngectomy was recommended.

On Sept. 5, 1946 the patient was tested intradermally with 2,000 units of noncrystalline commercial penicillin in 0.1 cc. of isotonic solution of sodium chloride. At the twenty-four to forty-eight hour reading there was a 4 plus reaction consisting of an area of induration and vesicles 2 cm. in diameter. Fifty units of the same brand of penicillin were injected intradermally at another site and induced an area of pronounced erythema 0.5 cm. in diameter after forty-eight hours. The trichophytin test in a 1:30 dilution was also strongly positive.

A laryngectomy was performed. In view of the previous eruption after the administration of penicillin and the positive skin test, penicillin therapy was withheld and prophylactic sulfadiazine therapy was substituted. In spite of this, sloughing occurred at the site of the tracheotomy. The suture line sloughed completely and despite further treatment with sulfadiazine infection of the wound continued with delay in healing. Further repairs were likewise unsuccessful.

The forty-eight hour intradermal test with 2,000 units of crystalline penicillin in 0.1 cc. of isotonic solution of sodium chloride was positive on Oct. 16, 1946. Nevertheless, because of the patient's unfavorable course it was deemed highly desirable to use penicillin if at all possible. Therefore it was decided to attempt desensitization to penicillin.

When desensitization was started on Dec. 5, 1946 a preliminary skin test with crystalline penicillin, 2,000 units in 0.1 cc. of isotonic solution of sodium chloride, again yielded a 4 plus reaction after forty-eight hours. Even 80 units injected intradermally elicited vesiculation and scaling in forty-eight hours.

The technic for desensitization consisted in subcutaneous injections of penicillin three times a week in gradually ascending doses. The first injection contained 400 units of noncrystalline

[2] Peck, S. M., and Hewitt, W. L.: The Production of an Antibiotic Substance Similar to Penicillin by Pathogenic Fungi (Dermatophytes), Pub. Health Rep. 60: 148-153 (Feb. 9) 1945.

penicillin. Each subsequent dose was doubled, so that 12,800 units were injected at the end of the second week. The increments were smaller thereafter, until 20,000 units were given as a maximum single injection. From Dec. 5, 1946 to Dec. 28, 1946 a total of twelve desensitizing injections were administered.

On Dec. 31, 1946 a skin test with 2,000 units of crystalline penicillin in 0.1 cc. of isotonic solution of sodium chloride produced only a pinhead-sized papule in forty-eight hours. The trichophytin test, done simultaneously, still produced a strong positive reaction.

It was then decided to administer single preliminary, provocative, intramuscular injections of penicillin before routine therapy with the antibiotic was initiated. Therefore on Jan. 2, 1947 the patient was given 5,000 units of commercial penicillin intramuscularly; again six hours later 10,000 units were administered without untoward reaction. The following day he was given a single dose of 30,000 units, which he tolerated well.

On Jan. 5, 1947 routine doses of 30,000 units of penicillin were started every three hours. After the fourth injection there was a cutaneous reaction involving the groin and gluteal regions. It consisted of sharply circumscribed erythema and edema. This reaction was thought to result from too rapid an increase in the dosage of penicillin. Therefore, penicillin therapy was suspended for twenty-four hours. Administration of the drug was then resumed on a reduced schedule of 10,000 units every three hours. After forty-eight hours the dosage was increased to 15,000 units, and it was again increased after two days to 20,000 units every three hours. This dosage was continued for the next four days and then increased to 30,000 units every three hours. This was continued for seventeen days without any adverse reaction. The eruption on the groin and buttocks faded gradually.

On Jan. 29, 1947, twenty-seven days after the first negative skin test, the patient was retested with both crystalline and commercial penicillin, 2,000 units in 0.1 cc. of isotonic solution of sodium chloride. There was again a negative cutaneous reaction to each preparation.

With the successful administration of penicillin following desensitization, wound healing began and continued satisfactorily.

SUMMARY

In a white man aged 63 there developed an erythematovesicular eruption after the parenteral administration of penicillin. This first appeared on the hands, feet and groin, and it rapidly became generalized.

The presence of a positive delayed skin test to penicillin and the re-elicitation of the eruption on subsequent use of the drug, indicate that the first eruption was due to penicillin sensitivity.

Successful desensitization, which permitted the administration of penicillin in effective dosage, is described.

Council on Physical Medicine

The Council on Physical Medicine has authorized publication of the following report.

HOWARD A. CARTER, *Secretary.*

BRANDT INFRA-RED LAMPS ACCEPTABLE

Manufacturer: M. Brandt & Sons, 58 East 181st Street, Bronx 53, New York.

The Brandt Infra-Red Lamps are for administering radiant heat. Model No. 332 stands on a 12 inch (30 cm.) floor base. The main upright rises 29 inches (74 cm.), and into it telescopes an additional upright about 25 inches (64 cm.) in length. The latter section bears an arm, which is 16 inches (41 cm.) in length, can be adjusted to various angles and lengths, and carries the lamp. It is therefore possible to set the lamp at any height above the floor up to about 70 inches (180 cm.). Models Nos. 536, 538, 532, 980 and 951 are with variation comparable to Model No. 332.

The heating unit of Model No. 332 draws 550 watts, is well housed, and is backed by a 12 inch reflector. In one series of tests the lamp was turned on thirty times averaging one and one-half hours each with sufficient intervals for complete cooling. The alternate heating and cooling did not result in any visible "creeping" of the base of the heating unit or corrosion of the socket. In a run of three hours there was no overheating of the base of the unit. The ventilation in the housing was good.

The lamp bears the name "Branson," which is the trademark of the firm.

The Council on Physical Medicine voted to include the Brandt Infra-Red Lamps, Models Nos. 332, 536, 538, 532, 980 and 951, in its list of accepted devices.

COSMO INFRA-RED TABLE LAMPS ACCEPTABLE

Manufacturer: Cosmo Sun Ray Products Co., Inc., 401 Lafayette Street, New York 3.

The Cosmo Infra-Red Table Lamps, Models 351 and 355, are designed for administering therapeutic heat by radiation. One model has a greater focusing range and the other model is for wide area diffusion. The burner of these lamps consists of resistance wire embedded in refractory material.

The lamps submitted by the firm have been tested as to durability, power consumption and other features. The Council on Physical Medicine voted to include the Cosmo Infra-Red Table Lamps, Models 351 and 355, and 301 and 476X, which are similar in construction to the aforementioned, in its list of accepted devices.

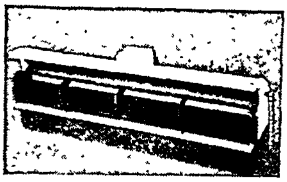
Cosmo Infra-Red Lamp
Model 351

THE GERMICIDAL UNIT ACCEPTABLE

Manufacturer: General Electric X-Ray Corp., 175 West Jackson Boulevard, Chicago 4.

The Germicidal Unit is designed for disinfecting wards, baby cubicles and operating rooms in hospitals. The fixture comes in two sizes, 30 watt and 15 watt. It is well constructed and is designed so as to prevent direct rays emitted by the source from reaching the eyes of the occupants of the enclosure, assuming that the unit is installed correctly. The source is a General Electric Germicidal Lamp (burner) the radiation of which is predominantly of wavelength 2,537 angstroms.

On being tested, the lamp was found to be satisfactory as a source of the specified type of radiation and acceptable for the uses which the Council recognizes for this type of equipment. The Council on Physical Medicine does not accept disinfecting lamps for use in offices, waiting rooms, theaters, school rooms, restaurants, hospital dining rooms or other places where people congregate. The use of disinfecting lamps is acceptable only in situations where theoretical considerations and facts of observation indicate that they can be effective, as, for instance, when properly installed in nurseries.



The Germicidal Unit.

With these reservations, the Council voted to include the Germicidal Unit manufactured by the General Electric X-Ray Corporation in its list of accepted devices.

INFECTIOUS MONONUCLEOSIS

World War II disclosed that infectious mononucleosis is a more common disease than is generally realized. Small epidemics as well as numerous sporadic cases have been reported. Notable features of this disease are its wide variety of clinical manifestations and physical findings. To emphasize these facts, Walker[1] classified the 29 cases which he reported into six different types: respiratory, febrile, lymphadenopathy, exanthematous, gastrointestinal, and central nervous system. While some cases overlap from one clinical type into another, certain symptoms are present in nearly all cases. These symptoms were weakness, headache, chilliness, sore throat, fever, anorexia and excessive perspiration. The respiratory type with sore throat, cough and pain beneath the sternum was most common. While fever may precede and be far out of proportion to the degree of upper respiratory disease, 3 of the 29 patients had no fever during their entire clinical course. An enlarged spleen was present in 25 of the 29 cases. Lymphadenopathy also is one of the most constant features, but in only 3 of Walker's cases did general lymphadenopathy overshadow such manifestations as chills, fever and respiratory infection. In epidemics of infectious mononucleosis skin eruptions may approach a 100 per cent incidence and be either urticarial, purpuric, erythematous, macular, maculopapular or petechial. In 1 patient a diagnosis of scarlet fever was considered; another case was diagnosed at first as German measles. False positive Wassermann tests were reported by another writer[2] in 4 cases with skin eruptions. The central nervous system manifestations may include, among others, dizziness, confusion, nystagmus, diplopia and a feeling of impending syncope. The main symptoms may arise from the gastrointestinal tract and simulate appendicitis, acute gastroenteritis or enteric fevers. In such cases surgical operations have been performed. Jaundice[3] and electrocardiographic evidence of acute myocarditis and first degree heart block have been reported.[4] Indeed the unpredictable symptoms of infectious mononucleosis may simulate numerous infectious or neoplastic disorders.

Two laboratory procedures aided in the diagnosis of many cases in the armed forces which otherwise might have remained unrecognized. A striking differential blood count is constant and typical in the shift toward an increase in mononuclear cells at the expense of the neutrophils.[5] The lymphocytes show a relative and absolute increase of at least 50 per cent sometime during the disease and the lymphocyte is atypical, with definite characteristics in different patients. Kracke and Garver say that the atypical lymphocyte is specific and should act as a definite diagnostic criterion. The heterophile sheep cell agglutinin test often helps to confirm the diagnosis. While sheep cell agglutinins are present in normal human serums, especially in patients subjected to serum therapy or suffering from serum sickness, when the antibody titer is higher than 1:64 it is said to be strong evidence of the presence of infectious mononucleosis. Although 8 of Walker's patients were seronegative, that can be explained by the fact that the sheep cell agglutinins reach a peak rapidly, usually in the first week or two of the disease, and disappear just as rapidly or subside gradually. Gardner and Paul[6] in an analysis of the records of 86 cases admitted to the New Haven Hospital found that this test had been positive in only 60 per cent of the cases, even at the height of the disease.

The pathologic changes produced by infectious mononucleosis were almost wholly unknown until three years ago, when Ziegler[7] reported those found in a patient who died following rupture of the spleen. Allen and Kellner[8] have since made a similiar report on a patient killed in an airplane crash a month after the onset of this disease. These two reports explain the diversity of clinical manifestations and show that infectious mononucleosis is a generalized disease in which cellular infiltrations may develop in almost any organ. The clinical picture, therefore, varies with the organs or system predominantly involved. While the lymph nodes, spleen and nasal pharynx are the more usual sites, involvement of the lungs, liver, kidneys, heart, brain, adrenals and testes account for the unusual cases. In Ziegler's report the lesions in the liver, kidneys and lungs consisted of focal infiltrations of mononuclear cells with reticulocyte proliferation and necrosis. The changes in the spleen were more diffuse than focal. Allen and Kellner reported no gross abnormalities in the viscera (not even in the spleen), but the retroperitoneal and hilar lymph nodes were grossly enlarged. While the microscopic lesions reported by them were similar in type and distribution to those reported by Ziegler, the lungs were of special interest, since primary atypical pneumonia had been diagnosed previously in their case on the roentgenologic evidence. At that phase of his illness the patient did not have clinical infectious mononucleosis, but it is possible that the nodular infiltrations in the lungs shown by x-ray examination were those of infectious mononucleosis rather than of atypical pneumonia. This patient had no symptoms referable to the central nervous system, but the microscope revealed perivascular infiltrations of lymphoid tissue similar to those found in mild virus encephalitis. The heart showed interstitial cell infiltrations compatible with conduction changes shown in the electrocardiogram. The cellular infiltrations found in the liver and kidneys explain the occasional case in which hepatitis or nephritis dominates the clinical picture.

As the cause of infectious mononucleosis has not been determined, cases will probably continue to go unrecognized unless clinicians keep in mind the protean manifestations of this disease.

THE REVIVAL OF THE OXFORD TUBERCULOSIS VACCINE

The vole bacillus, first described by Wells in 1937 as a cause of tuberculosis in the wild vole, Microtus agrestis, and suggested as a possible means of protection against tuberculosis in man, is again given consideration as a rival to BCG. Although dormant during the war in many countries,[1] experimental study was not abandoned entirely. Birkhaug[2] smuggled cultures into Norway and reported the results of long duration tests: the immune animals outlived the controls by two hundred to six hundred days, although the difference in survival time between the vole bacillus and the BCG vaccine was not significant.[3] However, the problem of vaccination in tuberculosis has gradually gained momentum with recognition of the significance of immunity and the importance of the best possible immunizing agent. It is evident from the extensive human vaccination tests being planned in the United States,[4] in spite of the numerous experiences with BCG in Europe and South America, that any general approval of BCG will be delayed.

Now, however, further sound words emanate from the Oxford investigators which show the changing trends and cast aside previous objections to the vole bacillus by American investigators[5] in favor of BCG or an avirulent human bacillus (for specific reasons) universally avirulent to man and animals. The vole bacillus is still pathogenic to the vole as well as to guinea pigs. The major concern for BCG at first was that it might return to virulence; now it is contended that it has so decreased in virulence that it is no longer an efficient antigen. On this basis it is suggested that the vole bacillus contains a suitable virulence for vaccination. The vole bacillus is not attenuated by cultivation in vitro, and the virulence for voles can be maintained indefinitely by passage. This, however, again centers on the whole problem of virulence and its significance as an antigen for tuberculosis vaccination, which apparently has not been settled[6] convincingly. Most important is the contention posed by the Oxford investigators that "to plan a controlled experiment in tuberculosis vaccination in man is a matter of so much difficulty as to be virtually impossible." This contention appears to be supported by the extensive BCG experience in man without apparent decision as yet.

According to the Oxford group none of the many reports hitherto published claim individually to give convincing proof of the protective value of BCG. "It is clear that such vaccination is rational, safe and capable of producing a tuberculin sensitivity in a high portion of persons."[7] Comparing BCG and the vole bacillus, it is maintained that the vole bacillus does not cause other than localized disease, the local reaction is similar to BCG, tuberculin allergy with the vole bacillus is greater and occurs earlier than that following BCG vaccination, the degree of induced resistance in guinea pigs is greater early in the disease but less late in the disease than with BCG, in cattle it may be more with vole, while in man no evidence is available, and the stability of virulence is greater than BCG, which is viewed as favorable to the use of the vole bacillus. Certainly the vole bacillus is presented as a challenge to BCG and as such should add impetus to the study of the important problem of tuberculosis immunity as well as its application for vaccination of man and possibly of cattle.

HORMONES AND CANCER

Estrogenic materials have been used for the palliative treatment of carcinoma of the prostate gland to relieve the victim of some of the discomforts arising from this disease. The action apparently is not curative and additional careful study of this procedure is essential, as such drugs are not wholly free of dangerous possibilities.

More recently further interest has been aroused in the relation of endocrines to cancer with the discovery that testosterone may have some effect on mammary cancer. While testosterone seems to have a palliative effect in some cases of breast cancer, other cases may be made immeasurably worse. At times the cancer can be caused to progress rapidly. Until a thorough and extensive study of this problem can be made the medical profession should not be encouraged to use testosterone or any other steroid in the treatment of breast cancer.

The indiscriminate use of hormones in cancer is associated with danger to such patients. The procedure is strictly in the stage of experimental investigation. And yet one manufacturer of testosterone preparations has the temerity to issue a booklet entitled "Progress in Cancer" in which the use of this hormone in the treatment of cancer is apparently presented as an established procedure with little need for worry about untoward effects. It is a reflection on the scientific control exerted over the advertising material of this firm, which apparently has a greater interest in promotion and sales than in the welfare of the sick.

The problem, which this manufacturer treats so lightly, is so important that the Therapeutic Trials Committee of the Council on Pharmacy and Chemistry has undertaken an exhaustive investigation of the use of testosterone and other steroids in mammary and, later, other cancers. There are many questions and many problems to be solved. A report will be issued in the near future by a special subcommittee. Until then it would seem wise to regard this new treatment only with interest, leaving the enthusiasm, if any, for those who are qualified by experience to express an authoritative opinion. It would be wise for all manufacturers and distributors of testosterone to adopt this attitude, remembering that a disservice to the medical profession, such as premature promotion, will eventually reflect unfavorably on those responsible for the disservice. Flamboyancy in advertising to the medical profession has no place today, especially when relating to a public health problem as serious as cancer.

Current Comment

ANTIVITAMIN ACTIVITY OF RELATED COMPOUNDS

That certain chemical compounds closely related to the various vitamins have "antivitamin" activity is now well established. In a review of this question, Woolley[1] points out that there is at least one known "antivitamin" for each of the water soluble vitamins and for two of the four fat soluble vitamins. Pyrithiamine, the antivitamin for thiamine, is an excellent example; when this substance is administered orally to mice or to rats, the classic symptoms of thiamine deficiency appear and the administration of a sufficient amount of thiamine will completely nullify the effect. The same phenomenon has been observed following the administration of certain analogues of riboflavin, pantothenic acid, pyridoxine, biotin, pteroyl-glutamic acid, ascorbic acid and niacin. A new antiniacin compound has been isolated from corn and has been identified as indole acetic acid.[2] One view[1] holds that the presence of this "pellagragenic" agent in corn is related to the relatively frequent occurrence of pellagra in corn-eating populations. The antagonistic action of chemical analogues is not limited to the vitamins alone, as might be expected. In the review cited,[1] a surprisingly varied list is given of important metabolites for which antagonistic chemical analogues have been found. The list includes a number of the amino acids, both essential and nonessential, several purines, porphyrins, and even two hormones, testosterone and thyroxine. One view[3] has been expressed that sex in higher animals may be in part an expression of metabolic competition between the androgens and estrogens. The mode of action of the various "antimetabolites" is as yet conjectural. The hypothesis which most nearly fits the observed facts is that the vitamins and other substances for which "antianalogues" have been found normally combine with a specific part of a protein to form the metabolically active compound, perhaps an enzyme. If the vitamin should be displaced from the protein by its analogue which cannot carry on its metabolic function, then functional failure would obviously result just as if the vitamin was entirely lacking in the diet. A somewhat analogous situation is seen in carbon monoxide poisoning, in which case the oxygen of hemoglobin is replaced by the related chemical substance carbon monoxide, and a failure in oxygen transport results. The inhibitory action of various analogues of metabolites has practical applications of great value in clinical medicine. The action of the various sulfonamide drugs in combating infectious diseases, for example, is undoubtedly a manifestation of this phenomenon. The sulfonamide compound apparently displaces some functional metabolite, probably p-aminobenzoic acid, in the micro-organism and the observed bacteriostatic action results. Future research in this general field should disclose many new facts of practical medical value.

ORGANIZATION SECTION

Medical Legislation

MEDICAL BILLS IN CONGRESS

Army-Navy Medical Services Corps Act of 1947

A bill proposing to revise the Medical Departments of the Army and Navy, H. R. 3215, has passed the House and Senate It proposes to establish in the Medical Department of the Regular Army a Medical Service Corps consisting of the Pharmacy, Supply and Administration Section, the Medical Allied Sciences Section, the Optometry Section, the Sanitary Engineering Section and such other sections as may be deemed necessary by the Secretary of War. A similar corps will be created in the Medical Department of the Navy. The President has approved this legislation.

Dental Research

A bill to provide for, foster and aid in coordinating research relating to dental diseases and conditions and to establish the National Institute of Dental Health as a division of the National Institute of Health, S. 176, has been passed by the Senate It proposes an appropriation of $2,000,000 for the construction of a building for the use of the Institute and an annual appropriation of $730,000 to carry out the purposes of the legislation, including grants-in-aid for research projects.

United States Public Health Service

Companion bills have been introduced to amend the Public Health Service Act in regard to certain matters of personnel and administration, S. 1454, introduced by Senator Taft, Ohio, and H. R. 3921, introduced by Representative Wolverton, New Jersey. Both bills have been favorably reported, with amendments. The general purpose of the legislation is to aid the Public Health Service in overcoming its professional personnel problems through revision of its promotion system, modification of its authority to make original appointments at advanced grades, and authorizing it to make expenditures necessary to keep its commissioned officers abreast of the latest developments in medical and related scientific and public health fields. One amendment recommended by the House Committee on Interstate and Foreign Commerce would authorize the appointment of osteopaths as commissioned medical officers in the Public Health Service.

Miscellaneous

H R. 4071 has been reported to the House, proposing to give the Food and Drug Administration jurisdiction over foods, drugs, devices or cosmetics when held for sale, whether or not the first sale, after shipment in interstate commerce.

Senator Pepper, Florida, for himself and Senator Murray, Montana, Senator Wagner, New York, Senator Taylor, Idaho, and Senator Chavez, New Mexico, has introduced S. 1714, a bill to provide for the general welfare by enabling the several states to make more adequate provision for the health of mothers and children and for services to crippled children. This legislation is similar to the bill introduced in the Seventy-Ninth Congress by Senator Pepper and other senators, S. 1318, proposing to enact the Maternal and Child Walfare Act of 1945.

S 1302 has passed the Senate, proposing to aid the associations, groups, organizations and institutions encouraging participation of the youth of the country in athletic and sports programs by making available to them surplus athletic equipment.

The Senate Committee on Finance has been authorized by S. Res 111 to make a complete and full investigation of old age and survivors insurance and all other aspects of the existing social security program for the purpose of assisting the Senate in dealing with legislation relating to social security.

The establishment of a United States Commission for the Promotion of Physical Fitness is contemplated by H R. 4255, introduced by Representative Hartley, New Jersey.

Senator Murray, Montana, for himself and Senator Wagner, New York, has introduced S. 1734, a bill to amend the Social Security Act by providing for a national system of unemployment and temporary disability insurance, including the providing for the furnishing of medical, surgical, institutional, rehabilitation, or other services to disabled individuals entitled to receive insurance benefits if such services may aid in enabling such individuals to return to gainful work. A companion bill has been introduced in the House by Congressman Dingell, Michigan, as H. R 4390. A similar bill has been introduced by Representative Donohue, Massachusetts, H. R. 4436.

A bill to amend Veterans Regulation Numbered 1 (a), parts I and II, H. R. 3889 has passed the House to establish a presumption of service connection for chronic and tropical diseases.

Legislation providing for water pollution control activities in the U. S. Public Health Service and in the Public Works Agency, S 418, has passed the Senate

A bill introduced by Representative Bolton, Ohio, as H. R. 4211, proposes to amend the federal Food, Drug and Cosmetic Act so as to prohibit the introduction into interstate commerce of salt sold or to be sold in containers containing 3 pounds or less of salt, granules of which will pass through a number 20 United States standard sieve, unless such salt contains suitable iodides in a quantity equivalent to not less than 75 parts and not more than 150 parts of iodine per million parts of such salt.

A bill introduced by Representative Welchel, Ohio, H. R. 4163, contemplates the providing of medical and hospital service for those employed in the maritime service.

An amendment to the social security act is proposed by H. R. 3636, introduced by Representative Forand, Rhode Island, to enable states to establish more adequate public welfare programs, including the supplying of medical services for certain needy individuals. A similar bill is pending in the Senate, S. 1355, introduced by Senator Cooper, Kentucky.

A bill introduced by Senator Saltonstall, Massachusetts, S. 1649, would authorize the payment of certain claims for medical care and treatment of personnel of the Army, Navy, Marine Corps, Coast Guard, Coast and Geodetic Survey and Public Health Service furnished other than by activities of the federal government.

Representative Goodwin, Massachusetts, proposes by H. R. 4430 to provide such hospitalization for members of the Reserve components of the Army, Navy, Marine Corps and Coast Guard in any army, navy or marine hospital as is necessary for the appropriate treatment of any disease, illness or injury suffered or contracted when such care and hospitalization can be provided within the limitations existing in such hospitals.

The Veterans Administration would be authorized to assist states, counties and municipalities in the treatment of veterans suffering from tuberculosis, by H. R. 3709, introduced by Representative Lane, Massachusetts.

Washington Letter

(From a Special Correspondent)

Aug. 27, 1947.

Hot Weather Increase in Poliomyelitis Below 1946 Total

A press service survey revealed that the usual hot weather increase in the number of cases of infantile paralysis has occurred, but the total is far below that of last year. Idaho reported the worst outbreak, with state authorities planning to set up an emergency committee in an effort to halt the spread of the disease. There were 60 cases there as compared with 11 at this time last year. Throughout most of the nation, the incidence of the disease was reported considerably below last year.

Veterans of Foreign Wars Blame Agency for Selecting Hospital Site

The Maryland Veterans of Foreign Wars has accused the Veterans Administration of wastefulness in spending more than $300,000 on the Nevius tract in Arlington County as the site for a veterans hospital, when land was available for $25,000 to $30,000 close to the present Naval Medical Center in Bethesda. The Nevius tract has since been abandoned. In addition, Dr. R. E. Dyer, director, National Institute of Health, expressed the opinion that it would be wise to erect the veterans hospital in Maryland. He points out that if it was near the U. S. Public Health Service's proposed $22,000,000 medical center it would be possible to exchange staff and facilities.

The Nevius tract is unsuitable for a veterans' hospital because it is too near Arlington cemetery for best morale of patients, according to Representative House Smith of Virginia, whose rider to a Veterans Administration appropriation bill halted work on the project. The government has already paid $850,000 for the site and spent $250,000 for plans.

Army Nurse Recruitment Deadline Extended

The War Department has announced that the July 31 deadline established for submission of applications for appointment to the new Regular Army Nurse Corps has been extended two months to September 30. This was done to give all qualified nurses a chance to apply, according to Col. Florence A. Blanchfield, Army Nurse Corps chief. Commissions are currently limited to officers between 21 and 34 inclusive who have served satisfactorily in the Army Nurse Corps during World War II. Women who are married or who have dependent children under 14 will not be appointed to the Regular Army.

Funds for Research in Heart Disease

Senator Pepper, Florida Democrat, asked the Senate Appropriations Committee to authorize $2,900,000 for the U. S. Public Health Service to finance research into causes and cures for heart diseases.

Bureau of Information

LOCATION OF PHYSICIANS

Virginia Shuler
Chicago

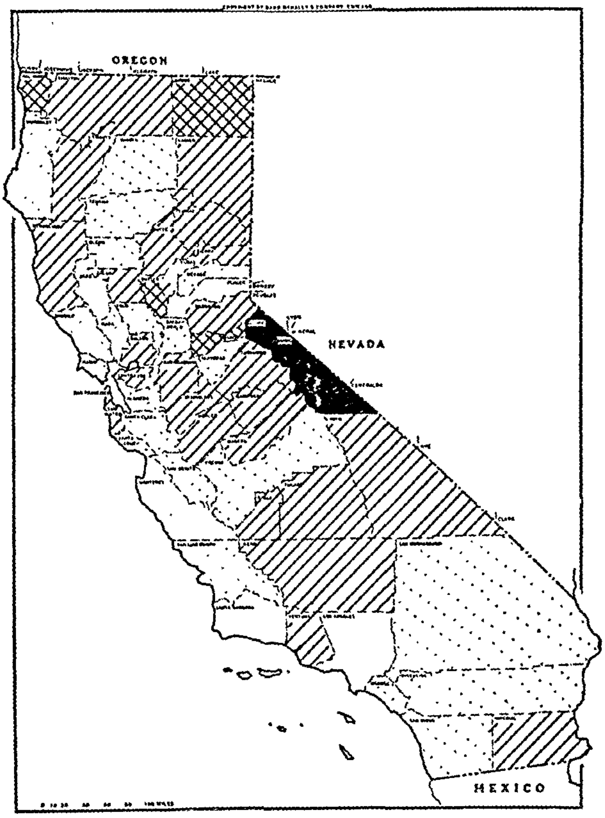
This is the ninth of a series of charts showing the trend in locations of physicians from April 1946 to January 1947.

"California's medical population, like its general population, has been increasing since prewar days and the in-migration continues today. The shipyards attracted many people to the state prior to the entry of the United States into the war, when ships were being built under lend-lease arrangements for France and Great Britain. With our own participation in the war, the shipyards and airplane plants combed the country for employees and the population of the state jumped some 2,500,000 in a period of about five years.

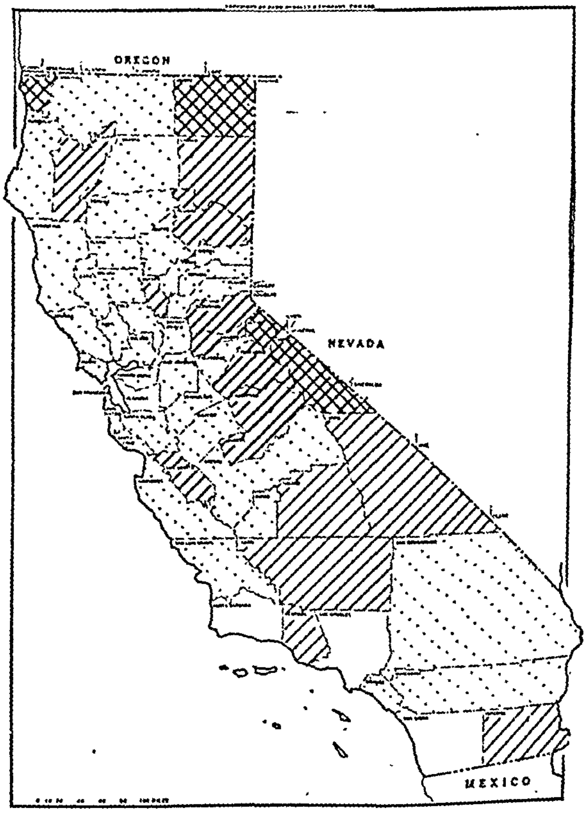
"With the presence of numerous army and navy camps in California throughout the war, and with California as the major jumping-off place for the Pacific war theater, many physicians spent weeks or months in California, and surveys now show that practically every doctor who went through California in a jeep has now decided to locate there. There are opportunities for doctors in practically every section of the state, although the tendency of most newcomers is to try to locate in the metropolitan areas of Los Angeles or San Francisco. There is little need for additional doctors in these areas, which have always maintained a high physician-population ratio, but there are numerous communities of smaller size which need additional medical services. Many of these are the smaller centers in the mountain areas, where outdoor life beckons the enthusiast and where medical practice can be carried on alongside gracious outdoor living. Some are lumber towns, some in the desert. Hospital facilities are not evenly distributed but in the main are fairly modern; naturally there is an overall shortage of hospital beds, since no construction took place during the booming population days of the war."

Mr. John Hunton, Executive Secretary,
California Medical Association,
450 Sutter Street, San Francisco 8.

CALIFORNIA—1946



CALIFORNIA—1947



Population for 1946 based on 1943 estimated census figures—for 1947 based on 1947 estimated figures submitted by state medical society, per active physician (excludes teaching, research, hospital administration, public health and state hospitals) by county.

Key: Physician-population ratio by county: plain area 1-999, dotted area 1,000-1,499, striped area 1,500-2,999, checked area 3,000 and over, solid black area no doctor.

Lincoln........................	Taft...........	350

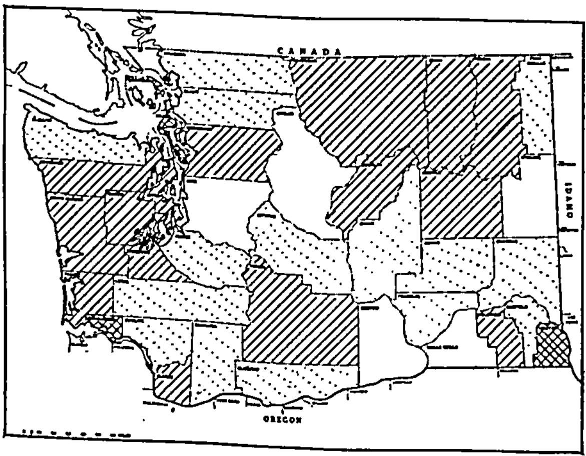
"We do not have any serious maldistribution of physicians in Oregon, and considerable improvement is to be observed since the war. In a number of instances young physicians, most of them war veterans, have located in "one doctor" towns, replacing old physicians who have died or retired.

"The Oregon legislature has enacted companion legislation to the federal hospital survey and construction act. Under authority granted by this legislation, the Oregon State Board of Health has established a Division of Hospital Survey and Construction, and a statewide survey of hospital needs and facilities is now under way.

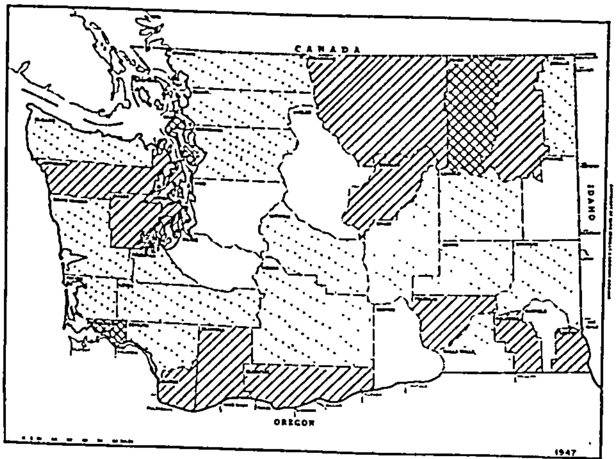
"Several Oregon communities are ready to begin construction of new hospital facilities. Most of these communities are raising their own funds through the county or other municipal corporation."

THOMAS S. SAUNDERS, M.D., Secretary,
Oregon State Medical Society,
1020 S. W. Taylor Street, Portland, Ore.

WASHINGTON—1946



WASHINGTON—1947



Population, based on 1943 estimated Census figures, per active physician (excludes teaching, research, hospital administration, public health and state hospitals) by county.

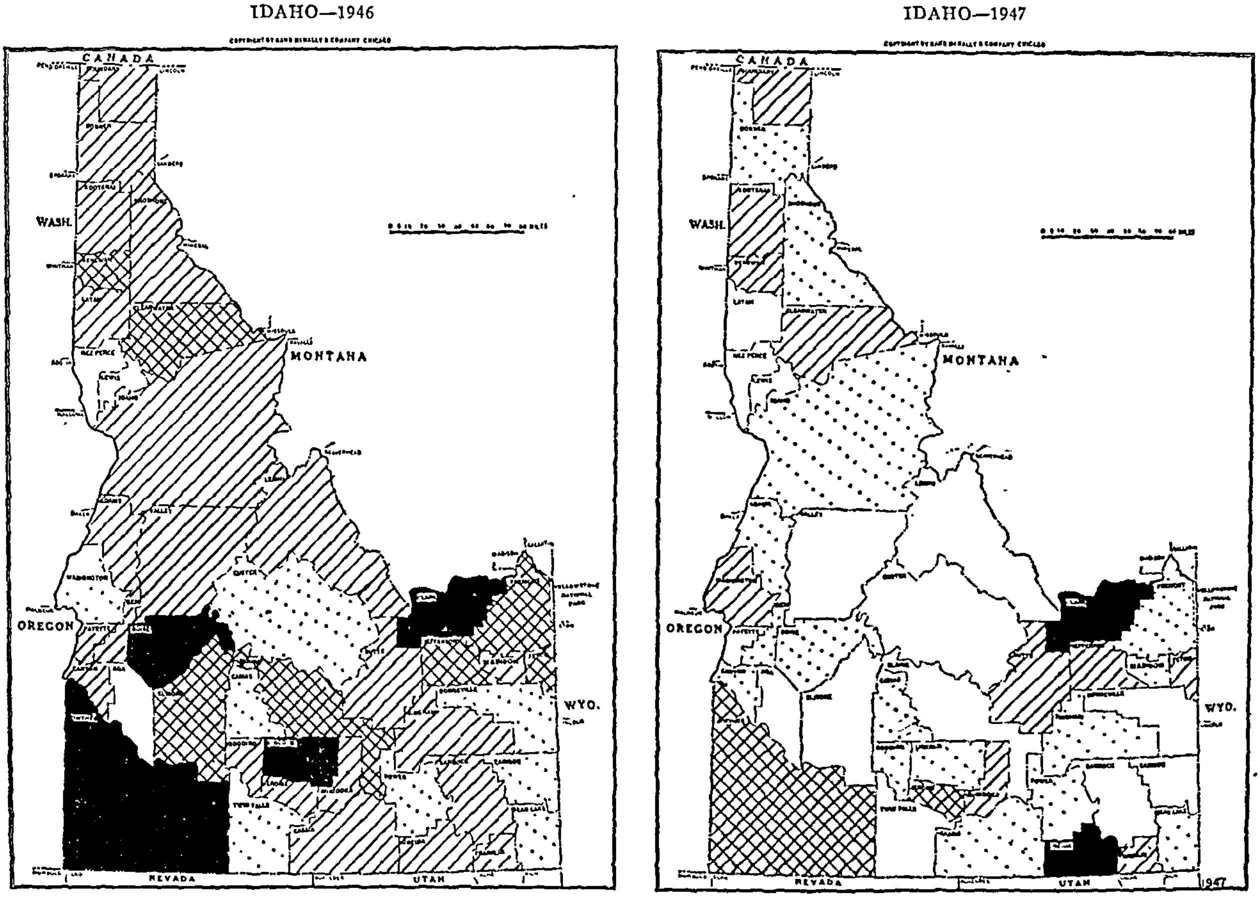
"Returning veterans and an influx of out of state doctors seem to have erased the shortage of doctors that existed in this state for the past several years, except for one or two isolated spots in the hinterland. These isolated spots exist in areas so sparsely settled that we as yet have been unable to locate doctors there. Our membership now numbers more than 1,800 doctors.

"There is, however, a shortage of specialists in several areas such as orthopedists, eye, ear, nose and throat specialists and pediatricians."

MR. RALPH W. NEILL, Executive Secretary,
Washington State Medical Association,
327 Cobb Building, Seattle.



IDAHO—1946

IDAHO—1947

Population, based on 1943 estimated Census figures, per active physician (excludes teaching, research, hospital administration, public health and state hospitals) by county.

"We are having a great deal of trouble in getting doctors to locate in towns of 2,000 or less, especially those without hospital facilities. The larger centers have adequate medical care, but it is anticipated that even they will be troubled with a shortage, as a great number of older men who carried on during the war are rapidly dropping out."

WILLIAM B. HANFORD, M.D., Past Secretary,
Idaho State Medical Association,
Caldwell, Idaho.

NEVADA

"Many doctors have migrated since the war into the two largest population centers of Nevada, Reno and Las Vegas, and both of these towns have grown proportionately. Doctors have about doubled in both these cities and the population has increased slightly less in proportion, about 40 per cent.

"There are about 50,000 people in the Reno area, with a little less than 80 doctors here, which is about 1 doctor to 600 or 700 population.

"In Las Vegas there are roughly 30,000 to 35,000 people and 30 doctors, which makes it a ratio of close to 1 doctor per each thousand population.

MORETON J. THORPE, M.D., Secretary,
Nevada State Medical Association,
17 N. Virginia, Reno, Nev.

Coming Medical Meetings

American Academy of Neurological Surgery, Colorado Springs, Broadmoor Hotel, Oct 9 11. Dr. T. C Erickson, 1300 University Ave, Madison 5, Wis, Secretary.

American Academy of Ophthalmology and Otolaryngology, Chicago, Palmer House, Oct 12 17 Dr W L. Benedict, 102 Second Ave S W., Rochester, Minn, Secretary.

American Anti Arthritis Association, Del Mar, Calif., Oct. 4 5. Dr. Robert T. Pottenger, 65 N Madison Ave, Pasadena, Calif, Secretary.

American Association of Medical Record Librarians, New York, Hotel Commodore, Sept. 7 12 Mrs Adaline Hayden, 18 E Division St, Chicago, Executive Secretary.

American Association of Obstetricians, Gynecologists and Abdominal Surgeons, Hot Springs, Va, The Homestead, Sept 4 6 Dr. James R. Bloss, 418 Eleventh St, Huntington 1, W. Va, Secretary

American Clinical and Climatological Association, Colorado Springs, Oct 13 15 Dr James Bordley III, Johns Hopkins Hospital, Baltimore 5, Secretary

American College of Surgeons, New York, Waldorf Astoria Hotel, Sept. 8 12 Dr. Paul B Magnuson, 40 E Erie St, Chicago 11, Secretary.

American Congress of Physical Medicine, Minneapolis, Hotel Radisson, Sept 2 6 Dr Richard Kovacs, 2 E 88th St, New York 28, Secretary.

American Congress on Obstetrics and Gynecology, St. Louis, Municipal Auditorium, Sept 8 12 Mr. Karl S. Richardson, 24 West Ohio St, Chicago, Business Manager

American Hospital Association, St Louis, Sept 22 25. Mr. George P. Bugbee, 18 E Division St, Chicago, Exec Secretary.

American Public Health Association, Atlantic City, Oct. 6 10 Dr. Reginald M Atwater, 1790 Broadway, New York 19, Executive Secretary

American Roentgen Ray Society, Atlantic City, Sept. 16 19. Dr. H. Dabney Kerr, University Hospitals, Iowa City, Secretary.

Central Neuropsychiatric Association, Galveston, Texas, Oct 17-18 Dr. William C Menninger, 3617 W Sixth Ave, Topeka, Kans, Secretary.

Colorado State Medical Society, Denver, Shirley Savoy Hotel, Sept 17 20. Mr. Harvey T Sethman, 1612 Tremont Place, Denver 2, Executive Secretary.

Connecticut Clinical Congress, New Haven, Sept 16 18. Dr Francis G. Blake, 258 Church St, New Haven, Chairman.

Delaware, Medical Society of, Wilmington, Oct 13 15. Dr. John F. Hynes, Memorial Hospital, Wilmington, Secretary.

District of Columbia, Medical Society of the, Washington, Oct 6 8. Mr. Theodore Wiprud, 1718 M Street N.W, Washington 6, Secretary.

International Cancer Research Congress, St Louis, Hotel Jefferson, Sept 2 7. Dr. Axel N. Arneson, 510 S Kingshighway, St Louis, Chairman Committee on Local Arrangements

International College of Surgeons, U. S Chapter, Chicago, Palmer House, Sept 29 Oct 2 Dr. Louis J. Gariepy, 16401 Grand River Ave, Detroit 27, Secretary.

Inter State Postgraduate Medical Association of North America, St. Louis, Public Auditorium, Oct. 14 17. Dr. Tom B Throckmorton, 406 Sixth Ave, Des Moines, Iowa, Secretary.

Kentucky State Medical Association, Louisville, Sept 29 Oct. 2 Dr P. E Blackerby, 620 S Third St, Louisville 2, Secretary.

Michigan State Medical Society, Grand Rapids, Pantlind Hotel, Sept. 23 26 Dr. L Fernald Foster, 2020 Olds Tower, Lansing 8, Secretary.

Mississippi Valley Medical Society, Burlington, Iowa, Oct. 1 3 Dr. Harold Swanberg, 510 Maine St, Quincy, Ill, Secretary

Nevada State Medical Association, Reno, Sept 4 6 Dr Moreton J. Thorpe, 17 N Virginia St, Reno, Secretary

Northern Minnesota Medical Association, Pequot Lakes, Breezy Point Lodge, Sept. 6 Dr. C L Oppegaard, Crookston, Secretary.

Oregon State Medical Society, Portland, Sept 4 6 Dr Thomas S. Saunders, 1020 S W. Taylor St, Portland 5, Secretary.

Pennsylvania, Medical Society of the State of, Pittsburgh, Hotel William Penn, Sept 15 18 Dr Walter F Donaldson, 500 Penn Avenue, Pittsburgh 22, Secretary

Southern Psychiatric Association, Birmingham, Ala, Oct 13 14 Dr. Newdigate M Owensby, 384 Peachtree St. N E, Atlanta, Ga, Secretary.

Utah State Medical Association, Salt Lake City, Sept 11 13 Dr Ray T. Woolsey, 316 Atlas Bldg, Salt Lake City 1, Secretary

Vermont State Medical Society, Burlington, Hotel Vermont, Oct 1 3. Dr. Theodore H Harwood, 128 Merchants Row, Rutland, Secretary.

Virginia, Medical Society of, Roanoke, Oct 13 15 Miss Agnes V. Edwards, 1200 E Clay St, Richmond 19, Secretary.

Washington State Medical Association, Seattle, Olympic Hotel, Sept 28-Oct 1. Dr Harold E Nichols, 327 Cobb Building, Seattle, Secretary.

Western New York and Ontario Urological Society, Saranac, N Y, Saranac Inn, Sept 3 6 Dr Albert M Crance, 525 S. Main St., Geneva, N Y., Secretary

Wisconsin, State Medical Society of, Milwaukee, Oct 6 8. Mr. Charles H Crownhart, 110 E Main St, Madison 3, Secretary.

World Medical Association, Paris, France, Sept 17 20 Dr Charles Hill, B M. A House, Tavistock Sq, London, W. C 1, England, and Dr. P. Cibrie, 60 boulevard de Latour Maubourg, Paris 7e, France, Joint Secretaries

GOVERNMENT SERVICES

ARMY

COURSE FOR AVIATION MEDICAL EXAMINERS

Twenty Medical Reserve Corps officers will attend a ninety day course at the School of Aviation Medicine, Randolph Field, Texas, this fall. Graduates of the course will be designated as aviation medical examiners. From October 6 to December 12 the course will stress the fundamentals of aviation medicine and the special examinations used for flying personnel. Those eligible are Medical Corps reserve officers under 40 years of age who are physically qualified for flying and have an efficiency index of 4 or better. Officers now designated as flight surgeons or aviation medical examiners will not be accepted for the course. Applications should be made in writing to the Military Personnel Section, Surgeon General's Office, the Pentagon, Washington 25, D. C.

NEW CHIEF OF NUTRITION BRANCH

George Hugh Berryman, Ph.D., formerly director of the Medical Nutrition Laboratory of the Surgeon General's Office, has been made chief of the nutrition branch of the Quartermaster Food and Container Institute for the armed forces. Dr. Berryman, after graduating at the University of Scranton and Pennsylvania State College, and after serving a fellowship in physiologic chemistry at the Mayo Clinic, obtained his Ph.D. from the University of Minnesota. After entering the Army in 1941 he was chief of the Division of Food and Nutrition of the Army Medical School in Washington; in 1944, when that division was expanded to become the Medical Nutrition Laboratory in Chicago, he was transferred to that city, becoming director with the rank of major in May 1946. Dr. Berryman plans also to resume his medical studies at the University of Chicago in October.

ARMY AWARDS AND COMMENDATIONS

Major General Howard McC. Snyder

The Distinguished Service Medal has been awarded to Major Gen. Howard McC. Snyder. The citation reads as follows: Major Gen. Howard McC. Snyder performed exceptionally meritorious and distinguished service as assistant to the inspector general from October 1940 to June 1945, displaying in his duties as a special medical inspector deep devotion to his task, courage of conviction and sound professional knowledge. He demonstrated a thorough understanding of the medical problems presented to the War Department and applied intense efforts to provide correct solutions for them. He made surveys at induction stations, reception centers and camps to accumulate highly valuable data and studied both the Mediterranean and European theaters of operation to effect greater efficiency in medical installations. Through his skilful and energetic approach to a wide variety of problems, General Snyder was largely responsible for the success of many important military functions. His was a material contribution to the war effort. Dr. Snyder graduated from the Jefferson Medical College at Philadelphia in 1905 and entered the military service in 1907.

NAVY

EXAMINATIONS FOR APPOINTMENT IN NAVY MEDICAL CORPS

The Bureau of Medicine and Surgery, Navy Department, announces that examinations for the selection of candidates for appointment to the grade of Assistant Surgeon with the rank of Lieutenant (junior grade) in the Medical Corps of the Navy will be held at all naval hospitals in the United States, October 6-10.

Graduates of approved medical schools in the United States or Canada who have completed intern training in accredited hospitals or who will complete such training within four months of the date of the examination and who are physically and in other respects qualified may be examined for appointment. Candidates, who must be less than 32 years of age at the time of appointment, will be required to appear before boards of medical examiners and supervisory naval examining boards at the naval hospital nearest their place of residence to demonstrate their physical and professional qualifications. Following approval by the President, selected candidates will be issued appointment and orders assigning them to duty in a naval medical facility.

The attention of prospective candidates is invited to Public Law 365, 80th Congress, which provides additional compensation of $100 a month for active service performed by medical officers. This is in addition to any pay, allowances or emoluments that medical officers are otherwise entitled to receive. A further proviso of the law limits the amount that is to be paid to any officer under this authority to a total of $36,000, computed on the basis of $1,200 for a period of thirty years' active service.

Information as to procedure of application may be obtained from the Bureau of Medicine and Surgery, Navy Department, Washington 25, D. C.

NAVY ADOPTS TUBERCULIN SKIN TEST

The Bureau of Medicine and Surgery of the U. S. Navy has recently introduced the tuberculin skin test in the physical examination of recruits in order to determine their fitness for duty in the Navy and the Marine Corps. After testing, all recruits will be classified into two groups, those who have positive skin reactions and those with negative reactions. Both classes will be reexamined annually to make certain that tuberculosis has not developed or further progressed. The information gained during the ensuing years, it is said, will be of value not only to the Navy but to the individuals concerned, and to public health in general.

NAVY AWARDS AND COMMENDATIONS

Captain Frederick S. Schofield

The Bronze Star Medal has been awarded to Capt. Frederick S. Schofield (MC), U.S.N.R., of Philadelphia. The citation reads as follows: For meritorious service as executive officer of the Koli Point branch of United States Naval Mobile Hospital Number Eight, Guadalcanal, in connection with operations against the Japanese from July 1, 1943 to May 17, 1944. Skilled and tireless in the performance of duty, he valiantly performed his complex professional and executive duties under conditions of fatigue and disease, insufficient equipment, medical supplies and personnel and constant danger from air attacks, contributing to the successful and efficient functioning of the large and expanding hospital. His unswerving devotion to duty, great professional skill and gallant concern for the welfare of his fellow men reflected great credit on Captain Schofield and upheld the highest traditions of the United States Naval Service. Dr. Schofield graduated from the University of Pennsylvania School of Medicine, Philadelphia, in 1920 and entered the military service in June 1941.

PUBLIC HEALTH SERVICE

DR. R. R. SAYERS BECOMES CHAIRMAN OF BOARD OF MINERS FUND

Dr. R. R. Sayers, medical director, U. S. Public Health Service, and director, U. S. Bureau of Mines, since 1940, has been granted leave without pay to accept the chairmanship of the medical board established by the trustees of the Welfare and Retirement Fund of the United Mine Workers of America. In this position Dr. Sayers will advise trustees of the miners' fund on health and medical problems and will assist state and local public health authorities, as well as coal operators and unions, in carrying out recommendations contained in the Medical Survey of the Bituminous Coal Industry issued last spring by Rear Admiral Joel T. Boone. The recommendations of the survey call for close cooperation among miners, operators, medical societies, health organizations and federal, state and local official agencies. Dr. Sayers is an authority on various industrial health problems. His studies on carbon monoxide resulted in the development of the ventilation system used in vehicular tunnels throughout the world. His introduction of warning agents into manufactured and natural gas, which are otherwise odorless, makes leakages of gas detectable. He is an authority on pneumonoconiosis. A native of Indiana, he obtained his M.D. degree from the University of Buffalo School of Medicine. He became a commissioned officer of the U. S. Public Health Service in 1915 and served as chief of the Industrial Hygiene Division from 1933 to 1940.

POSTGRADUATE EDUCATION IN MARINE HOSPITALS

There are 119 rotating internships available in the U. S. Marine Hospitals: 36 in Staten Island, 12 in Baltimore, 10 in Norfolk, 12 in New Orleans, 14 in San Francisco, 12 in Seattle, 6 in Chicago, 6 in Detroit, 6 in Cleveland and 5 in Galveston. Eight mixed internships are available in the Boston Marine Hospital. Application blanks may be obtained by addressing a request to the Surgeon General, U. S. Public Health Service, Washington 25, D. C.

Internships.—Approved one year mixed and rotating internships are offered in eleven Marine Hospitals to graduates of approved medical schools. The policy of the Public Health Service regarding medical internships is as follows:

1. Recruitment and selection of interns will be done in accordance with the agreement for intern placement which has been approved by the Association of American Medical Colleges.

2. The Committee on Internships will review applications and select applicants as required by the service. With due consideration to the applicant's expressed preference, the committee will designate the hospitals to which successful applicants are to be assigned.

3. All candidates selected for internships in Marine Hospitals may be considered for commissions in the grade of assistant surgeon (comparable to first lieutenant, army rank) in the Reserve Corps of the Public Health Service. Interns so commissioned will serve on an active duty status and will enjoy all the rights and privileges of commissioned officers.

4. Candidates who, for physical or other reasons, fail to meet the requirements for a commission may be appointed on a civil service basis. Such appointments are not subject to the civil service classification act and do not therefore entail the taking of an examination.

5. Candidates appointed as interns in either category will not be transferred or assigned to any other duty before they have completed their internships except for unsatisfactory performance in the internship assignment.

6. All applicants will be requested, where geographically feasible, to appear for a personal interview at one of the Marine Hospitals conducting postgraduate training.

Residency Training in Medical Specialties

Residency training programs in several of the medical specialties are offered in 8 Marine Hospitals to graduates of approved medical schools who have successfully completed at least one year in an approved internship. The policy of the service regarding residents in the Marine Hospitals is as follows:

1. Selection and appointment of applicants for residency training is made by the Residency Training Board, with due consideration to the applicant's expressed preference of hospitals where a choice exists.

2. While the service is primarily interested in training its young medical officers, a number of outside candidates will be selected each year. The latter may be commissioned in the grade for which they qualify in the Reserve Corps of the Public Health Service and will serve in an active duty status with all the rights and privileges of commissioned officers. However, those selected who for physical or other reasons do not qualify for a commission may be appointed in a civil service status.

3. Residents will not be subject to transfer to other types of duty or to other assignments before the period of training for which they are appointed has been completed except for unsatisfactory performance in the residency assignment.

4. All appointments are made for twelve month periods, beginning each July 1. Reappointments to the second and third years of residency training will be conditioned on quality of performance, as reported to the residency training board by the education committee of each hospital. Applications for original appointment must be on file in headquarters by November 1 of each year and appointments will be made not later than February 1. Application blanks may be obtained by addressing a request to the Surgeon General, U. S. Public Health Service, Washington 25, D. C.

5. Where geographically feasible, applicants will be requested to report for a personal interview at one of the Marine Hospitals conducting postgraduate training.

Residency training to begin July 1, 1948 is offered in the medical specialties indicated at the following Marine Hospitals:

Hospital	Residencies (Beginning July 1, 1948)
Staten Island........................	*Internal medicine General surgery *Orthopedic surgery Urology Dermatology and syphilology *Radiology (diagnostic) Pathology Ophthalmology and otolaryngology
Baltimore Marine Hospital..........	*Internal medicine *General surgery *Urology *Radiology *Pathology
San Francisco Marine Hospital.....	*Internal medicine *General surgery Ophthalmology and otolaryngology
New Orleans Marine Hospital.......	Internal medicine *General surgery Radiology *Pathology *Ophthalmology and otolaryngology
Seattle Marine Hospital.............	Internal medicine General surgery Ophthalmology and otolaryngology
Detroit Marine Hospital............	*General surgery
Boston Marine Hospital............	Internal medicine *General surgery
Ellis Island Marine Hospital (N.Y.)	*Psychiatry

* Indicates residency approved by Council on Medical Education and Hospitals of the American Medical Association. Application for similar approval has been made for several of the residencies not so designated.

PERSONAL

Dr. Ray H. Vanderhook has been assigned chief of the surgical service at the U. S. Public Health Service hospital, Lexington, Ky., succeeding Dr. Fred Oesterle, who has been assigned to the marine hospital at Staten Island, N. Y., to take postgraduate work in surgery.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

CALIFORNIA

The Fox Foundation for Urology.—Mr. R. S. Fox of Seattle has made an initial grant of $25,000 for scientific research or educational development in the field of urology with no restrictions on the use of principal or interest for this purpose. Needy patients suffering from urologic diseases are to be given free or part pay medical and hospital service. Eventually the plan is to establish a urologic ward in one of the local hospitals. Principal office of the Fox Foundation for Urology will be at 233 North Greenleaf Avenue, Whittier. Dr. W. O. Mendenhall, former president of Whittier College, Whittier, has been named chairman of the foundation, and Dr. Franklin Farman, Whittier, the director.

Dr. Charles Nelson Honored by Sweden.—Dr. Charles F. Nelson, founder of the Nelson Clinic in Beverly Hills, will receive the Swedish insigne of the Royal Order of Vasa, First Class, from the Swedish consul at ceremonies September 12 in the Ambassador Hotel, Los Angeles. Dr. Nelson is being honored for achievements in the practice of medicine and surgery and for his medical research. Dr. Nelson graduated at Rush Medical College, Chicago, and served his internship at the Los Angeles General Hospital. At the annual session of the American Medical Association in 1940 in New York he was awarded the bronze medal for an exhibit on bone metabolism. He received the Ling medal for work for children in 1938 and the award from the California State Medical Association for physiochemical approach to the study of bone problems.

COLORADO

Appoint Clincal Director at Medical Center.—Dr. Leighton L. Anderson, director of the outpatient department at Colorado General Hospital, Denver, has been appointed to the new post of clinical director at the University of Colorado Medical Center. He will have administrative supervision of the resident and intern staff in addition to his present position at the hospital. Dr. Anderson received his medical degree at the Columbia University College of Physicians and Surgeons, New York, 1938. He served in the U. S. Army Medical Corps in the recent war.

ILLINOIS

State Society to Publish History.—The Illinois State Medical Society has appealed to veteran physicians, members of families of pioneer Illinois medical men and others who might have access to or knowledge of historical material relating to the practice of medicine in Illinois from 1850 to the present to cooperate in the society's project to publish a complete medical history of Illinois. The first volume, covering the years up to 1850, was published in 1927 with the late Dr. Lucius H. Zeuch, Chicago, as editor. The society is going ahead with plans for at least two more volumes and is issuing an appeal for any information concerning physicians, hospitals, public health, medical biography and other data of value in the history of medicine in Illinois. The society is particularly anxious to complete its files of transactions of the society printed in book form from 1850 to 1899 and hopes that persons searching old collections will report all volumes.

Chicago

Report on Tuberculosis Survey.—Over 200 cases of tuberculosis were found among 14,967 residents of Maywood and Melrose Park who were surveyed this spring (The Journal, April 12, p. 1163). The Tuberculosis Institute of Chicago and Cook County reported that about 50 per cent of the population volunteered for the x-ray examination.

Award for Film on Bronchial Tumors.—Dr. Paul H. Holinger, assistant professor of otolaryngology at the University of Illinois College of Medicine, and Dr. Ralph G. Rigby of Salt Lake City, have been named winners of the grand prize in the scientific film section at the World's Film and Fine Arts Festival to be conducted at Brussels, Belgium. Dr. Holinger and Dr. Rigby submitted the film "Bronchial Tumors," a Kodachrome movie of the bronchi taken through a bronchoscope. Dr. Rigby is a former member of the University of Illinois faculty. The prince regent of Belgium will present the prize to a representative of the state department this fall.

Hospital News.—Contracts were recently let by Mount Sinai Hospital for the erection of two additional floors, which will house 60 more patients. When completed early next spring, the new addition will give the hospital a capacity of 300 beds and 44 bassinets.——Swedish Covenant Hospital has begun construction of a $600,000 educational building and nurses' dormitories across the street from the hospital. The ground floor of the main section of the building will contain a student chapel, library and living quarters for the superintendent and administrative and household staffs, with business offices. On the second floor will be two large class rooms as well as the nursing arts, dietetics and science laboratories and nurses' training school offices. The remaining space of the five floors will provide dormatories for 125 student nurses.

INDIANA

Course for Practicing Physicians.—Indiana University School of Medicine, Bloomington-Indianapolis, is offering its annual postgraduate course for practicing physicians on the Medical Center campus during the week of October 6. Therapeutic aspects will be emphasized in the clinics, reviews and lectures in about twenty fields of interest to the general practitioner. The course is offered without tuition charge.

State Hospital Superintendent.—Dr. Charles A. Zeller, former superintendent of the Fairview State Hospital for the Criminal Insane, Scranton, Pa., has been appointed director of the Indiana Council for Mental Health and superintendent of the Madison State Hospital in Indiana. He is a graduate of the University of Buffalo School of Medicine, 1927, and held a similar position for some time at the Philadelphia Mental Hospital at Byberry.

KENTUCKY

State Medical Meeting.—The Kentucky State Medical Association will hold its annual meeting September 29 to October 2 in Louisville under the presidency of Dr. Elbert W. Jackson, Paducah. There will be a special session of the House of Delegates on September 28 to take final action on prepayment medical care plans for Kentucky. Among the subjects on the scientific program to be discussed by members of the association are the treatment of syphilis, advances in the care of acute appendicitis, chemotherapy, problems in infant feeding, medical problems in the community hospital, knock knees and bowlegs, and diseases of the eyes that general practitioners should know about. The oration in surgery will be given by Dr. J. Duffy Hancock, Louisville, on "Surgical Horizons," and the oration in medicine by Dr. Rankin C. Blount, Lexington, on "Practical Aspects of Psychosomatic Medicine." A Technicolor sound movie on cancer control is part of the Tuesday evening program. The guest speakers include Dr. Edward L. Bortz, Philadelphia; Dr. George F. Lull, Secretary and General Manager, American Medical Association, Chicago, and Rev. Alphonse M. Schwitalla, S. J., St. Louis.

MASSACHUSETTS

Public Health Conference.—The Massachusetts Public Health conference will be held at the University of Massachusetts, Amherst, September 11-12. Sponsored by the Massachusetts Public Health Association, the university and the Massachusetts Department of Public Health, the conference is intended to stimulate interest in extending protective health services to communities which lack facilities and personnel. Health officers, milk inspectors, sanitarians, nurses, physicians, health educators and other health workers throughout the state are expected to attend. Among the topics to be discussed are bringing health services to your back door, functions of health centers, unmet needs for children and combined nursing services for local communities. Special section meetings will be held for health officers, health agents, nurses and sanitarians. Reservations for overnight accommodations may be made by writing Professor Ralph L. France, Marshall Hall, University of Massachusetts, Amherst.

MINNESOTA

Dr. McIndoe Honored.—It has recently been announced from London that knighthood has been conferred on Dr. Archibald H. McIndoe for contributions in plastic surgery before and during the war in services to the state. Dr. McIndoe received his training in surgery in this country, where he was a fellow of the Mayo Foundation of the University of Minnesota from 1925 to 1930. Following this training he undertook work in England.

NEW YORK

Licenses Revoked and Suspended.—The Board of Medical Examiners of the State Education Department reports that by action taken by the Board of Regents the medical licenses of the following persons have been revoked: Ibrahim J. Abdallah, Brooklyn; Simon Bloom, New York; Nicholas E. Caputo, Brooklyn; I. Hugo Francese, New York; Mae Graziano Perez, New York; Nicholas A. Tonis, New York. The license of Hirsch L. Messman, New York, was suspended for one year beginning May 29, 1947.

Diabetic Research.—The New York Diabetes Association, Inc., has made research grants to Dr. I. Arthur Mirsky, director, May Institute for Medical Research, Jewish Hospital, Cincinnati, for studies of "The Extraction of Insulin from the Urine"; to Dr. Elaine P. Ralli, New York University College of Medicine, New York, for "Factors Influencing the Plasma Levels of Vitamin A and Carotene in Patients with Diabetes Mellitus"; to Dr. Thomas H. McGavack, New York Medical College, Flower and Fifth Avenue Hospitals, New York, for the study of "The Ketosteroids in the Male Diabetic, the Blood Potassium in Diabetic Coma and the Use of Rutin in the Treatment of Retinopathy in Diabetics," and to Albert E. Sobel, Ph.D., Brooklyn Jewish Hospital, Brooklyn, for "The Metabolism of Vitamin A in Diabetes Mellitus."

New York City

Two Hospitals Merge.—To provide Brooklyn with more coordinated medical facilities, Israel Zion Hospital and Beth Moses Hospital, both of Brooklyn, have merged under the new name Maimonides Hospital. They will continue to occupy their present quarters and carry on their present functions for a time. Future plans include an expansion of facilities of the Israel Zion Division to 577 beds, the total capacity of both hospitals. The Beth Moses Division is to be converted into an institution for care of long term clinical and nonambulatory patients, heretofore uncared for by both hospitals.

Academic Training for Hospital Physicians.—A plan for New York University College of Medicine to cooperate with rural and suburban hospitals to aid young staff physicians in postcollegiate academic training will get under way in September. Young physicians at the participating hospitals will be required to study one year at the College of Medicine after a full year of hospital work. The plan calls for monthly visits to the hospitals by members of the faculty of the College of Medicine. They will organize and participate in conferences or any other academic exercises and will aid the physicians in solving technical problems. Hospitals scheduled to participate are New Rochelle Hospital; Flushing Hospital and Dispensary, Queens; Monmouth Memorial Hospital, Long Branch, N. J.; Fitkin Memorial Hospital, Neptune, N. J.; St. Luke's Hospital, Newburgh, N. Y., and North Country Community Hospital, Glen Cove, L. I. By 1948 thirteen hospitals within 140 miles of New York are expected to enroll. The plan has been developed on a noncontractual basis, and member hospitals may withdraw support at any time.

OHIO

Establish Department of Radiology.—A new department of radiology has been established at Ohio State University College of Medicine, Columbus, with Dr. Hugh J. Means, chairman, and fourteen faculty members on the staff. The department will offer instruction in x-ray work for graduate and undergraduate medical students and opportunities for independent research. Heretofore the teaching of radiology at Ohio State has been administered in the department of surgery. Dr. Means, a graduate of the University of Pennsylvania School of Medicine, Philadelphia, has been a member of the Ohio State University faculty since 1908. He has taught radiology for thirty-three years, during which period he also has served as radiologist at University Hospital. He became professor of radiology in 1943 and director of radiology at University Hospital in 1945. Members of the department supervise the radiologic service in other hospitals in addition to University Hospital.

Western Reserve to Train Clinical Psychologists.—The U. S. Public Health Service, in accordance with the Federal Mental Act recently signed by President Truman, has made a grant of $8,232 to Western Reserve University, Cleveland, for the expansion of the training program for clinical psychologists. An agreement has also been made between the university and the Veterans Administration whereby the two agencies will conduct a training program for clinical psychologists on a cooperating basis. These arrangements were made in response to a heavy demand for clinical psychologists in hospitals and other institutions throughout the country in an effort to solve the problems of emotional and mental illness. Of the total amount of the grant, $1,200 will be used as a stipend for two graduate students for one year and the remainder to employ a full time faculty member and secretary to aid in the training program. Under the arrangement with the Veterans Administration, about 15 students will take part in studies and field work leading to a Ph.D. in clinical psychology over a period of four years, half of which time will be spent at the Veterans Hospital in Brecksville, Ohio, and the remainder at Western Reserve. The president of the university has announced the appointment of two additional men to the staff of the psychology department: Dwight W. Miles, formerly chief clinical psychologist for the Cleveland Clinic Foundation Hospital in Cleveland, and Daniel Levinson, formerly of the University of California.

PENNSYLVANIA

Annual Meeting of State Society.—The ninety-seventh annual session of the Medical Society of the State of Pennsylvania will be held in the Hotel William Penn, Pittsburgh, September 15-18, under the presidency of Dr. Howard K. Petry, Harrisburg. At the general assembly Wednesday evening Dr. Joseph D. Aronson, Wayne, will speak by invitation on "The Present Status of BCG Vaccine in the Prevention of Tuberculosis." The rest of the scientific program is divided into sections. Guest speakers on the scientific program include:

Dr. Richard H. Freyberg, New York, Practical Consideration of Management of Arthritis.
Dr. Henry M. Thomas Jr., Baltimore, Role of the Thyroid in Health and Disease.
Drs. Jonathan E. Rhoads and Charles Kirby, Philadelphia, Problems of Phlebothrombosis.
Dr. Samuel F. Marshal, Boston, Gastric Carcinoma.
Dr. James T. Priestley, Rochester, Minn., Surgical Treatment of Jejunal Ulcer.
Dr. Peter C. Kronfeld, Chicago, Reoperation for Glaucoma.
Dr. Edwin N. Broyles, Baltimore, Treatment of Carcinoma of Larynx.
Dr. Joseph A. Ritter, Philadelphia, Rose R. O'Connell and Edward Lucente, Infectious Diarrhea of the Newborn—Report of an Epidemic.
Dr. George B. Logan, Rochester, Minn., Management of Allergic Disease of the Respiratory Tract in Children.
Drs. John J. McAleese, Grace S. Gregg and Frank J. Gregg, Pittsburgh, Surgery in Congenital Heart Disease.
Dr. Mitchell I. Rubin, Buffalo, Studies on Renal Function in Childhood.
Dr. Anthony C. Cipollaro, New York, Diagnosis and Treatment of Cutaneous Cancer.
Dr. William J. Engel, Cleveland, Safety Factors in Prostatic Surgery.
Dr. Herbert E. Schmitz, Chicago, Treatment of Carcinoma of Cervix with Supervoltage X-Ray Therapy and Radium.
Dr. Edward G. Waters, Jersey City, Extraperitoneal Cesarean Section.
Dr. Howard P. Doub, Detroit, Roentgen Studies of Thoracic Tumors.
Drs. Henry F. Hunt and Samuel W. Berkheiser, Danville, Primary Carcinoma of the Liver.
Dr. Shields Warren, Boston, Effects of Atomic Bomb on Populations of Hiroshima and Nagasaki.
Dr. Wingate M. Johnson, Winston-Salem, N. C., General Practice of Medicine.
Dr. James H. Wall, White Plains, N. Y., Fundamentals of Psychiatry for General Practitioners.
Dr. Nolan D. C. Lewis, New York, Trends in Present Day Psychiatry.
Dr. Allen O. Whipple, New York, Clinical Training in Diagnosis and Treatment of Cancer.

TEXAS

Dr. Moore Named Head of Department.—Dr. Robert M. Moore, professor of surgery at the University of Texas Medical Branch, where he has been on the faculty since 1930, has been named chairman of the department of surgery. Dr. Moore received his M.D. degree from Washington University School of Medicine, St. Louis, 1926. He interned and was an assistant resident surgeon at Barnes Hospital, St. Louis, from 1927 to 1929. He was a National Research Council fellow in the department of physiology at Harvard Medical School, Boston, 1927-1929, and has been associated with the surgical department at John Sealy Hospital, Galveston, since 1930.

WEST VIRGINIA

State Silicosis Board.—Two Charleston physicians have been reappointed members of the state silicosis medical board. Dr. William C. Stewart, Charleston, was reappointed for the term expiring July 8, 1951 and Dr. George F. Grisinger, Charleston, for the term expiring July 8, 1949. Dr. Grisinger will serve as chairman of the board for the year ending July 8, 1948. Dr. William P. Elkin, Charleston, was appointed on July 8 as a member of the board to succeed Dr. Sanders G. Davidson, Bluefield. His term expires in 1953.

Tuberculosis Association Meeting.—The annual meeting of the West Virginia Tuberculosis and Health Association will be held September 17-18 at the Daniel Boone Hotel, Charleston. There will be conferences of full time county secretaries Thursday morning, a demonstration workshop in the afternoon and demonstration of a diagnostic clinic by the control staff of the bureau of tuberculosis of the state health department. Dr. James R. Reuling, president of the National Tuberculosis Association, will be the speaker at the annual banquet. A general program session and the annual luncheon will be held Friday.

GENERAL

Italian Sausages Seized at Port.—Federal inspectors seized nearly 3,000 pounds of prepared meats from the luggage of 1,393 passengers arriving in New York, July 28, aboard the Italian liner *Saturnia.* Under a new ruling that all meats in the country must be hermetically sealed to prevent spread of hoof and mouth disease the meats, mostly Italian sausages, were taken from passengers who had been given a presailing warning.

Increase in Death Rate from Leukemia.—The Metropolitan Life Insurance Company, New York, reports that leukemia takes more than 6,000 lives annually in the United States, many of them among children. The death rate reported from leukemia is said to have more than doubled in twenty-five years and is more than five times that of infantile paralysis, about one and one-half times that of measles, scarlet fever, whooping cough and diabetes combined, and almost equal to that of appendicitis.

Dr. Jirasek to Visit United States.—During September and October Dr. Arnold Jirasek, head of the first surgical clinic of Charles University, Prague, and chairman of the department of surgery for twenty years, will visit the chief neurosurgical centers of the East and Middle West and Canada under the auspices of the Rockefeller Foundation. He is president of the Czechoslovakian surgical society, a member of the Academy of Surgery of Paris, the International Society of Surgeons, of which he was first president, and the North American Postgraduate Assembly.

Tuberculosis Conference.—The Mississippi Valley Conference on Tuberculosis, under the presidency of Dr. J. Arthur Myers, Minneapolis, and the Mississippi Valley Trudeau Society, under the presidency of Dr. John H. Skavlem, Cincinnati, are meeting jointly September 8-10 at the Edgewater Beach Hotel, Chicago. Subjects to be discussed are the Christmas Seal Sale, Organization for Education and Follow-Up in Community Wide X-Ray Programs, and Social and Economic Needs. A streptomycin symposium will be held Tuesday at 2 p. m. and an x-ray conference at 8: 30 that evening. Other papers also will be presented.

Medical and Surgical Relief Committee Reorganizes.—The Medical and Surgical Relief Committee, New York, is now in process of reorganization under the chairmanship of Admiral William F. Halsey. The committee organized in 1940 for equipping British emergency stations and field hospitals with medical and surgical supplies. Approximately fifty physicians and surgeons responded, and a working organization was set up in New York City. When it soon became evident that other countries needed supplies, the committee's inventory was placed at the disposal of the American Red Cross, the Office of Civilian Defense and hospitals in North, Central and South America and American possessions.

Credit for Work in the Armed Forces.—The American Board of Psychiatry and Neurology wishes to point out that in order to avoid misunderstanding regarding the allowance of one year of training credit for work in the armed forces during wartime it should be noted that wartime to the board means V-J day plus six months. Therefore, men who entered the service on V-J day would be allowed six months' credit. Men who entered the armed forces after February 1946 will not be granted credit toward the training requirements unless they were residents in hospitals approved by this board for residency training. If they have practiced psychiatry or neurology during this time, however, it is probable that this will be counted toward the experience requirements.

Acting Medical Director of American Cancer Society.—Dr. Charles S. Cameron has been appointed acting medical and scientific director of the American Cancer Society following the resignation of Dr. Ashley W. Oughterson, New York, who had served since April 1946. Dr. Cameron came to the society in June 1946 as assistant medical and scientific director and in January also assumed the duties as director of the service department. A graduate of Hahnemann Medical College and Hospital, Philadelphia, 1935, he served on the resident staff for four years at Memorial Hospital in New York before going into the service. In addition to overseas assignments with the naval medical corps he was stationed at Brooklyn Naval Hospital as chief of tumor service.

Mississippi Valley Meeting.—The twelfth annual meeting of the Mississippi Valley Medical Society will be held in the Municipal Auditorium, Burlington, Iowa, October 1-3 under the presidency of Dr. Walter A. Sternberg, Mount Pleasant, Iowa. On October 1 an all St. Louis program will be presented. October 2 the speakers include the President of the American Medical Association and presidents of the Illinois, Iowa and Missouri state medical societies. The afternoon program will be presentations by a group from the State University of Iowa College of Medicine, Iowa City. October 3 will feature an all Chicago program with a number of well known clinical teachers. There will be no registration fee. Information may be secured from Harold Swanberg, M.D., Secretary, 209-224 W. C. U. Building, Quincy, Ill.

New Pediatric Journal.—The American Academy of Pediatrics will publish a new monthly journal called *Pediatrics* beginning in January 1948 containing original articles on clinical pediatrics, nutrition, genetics, preventive medicine, psychology, nursing and medical sociology, education and social welfare of children. A special section will be devoted to Latin American countries, where the academy has a program in operation. Abstracts of all original articles will be published in Spanish. Matters of interest in Congress, government departments and agencies in Washington will be reported. Communications of an editorial nature should be addressed to the editor in chief, Hugh McCulloch, M.D., 325 North Euclid Avenue, St. Louis 8. Advertising matters and subscriptions should be sent to Charles C Thomas, publisher, 301-327 East Lawrence Avenue, Springfield, Ill.

Prevalence of Poliomyeltis.—Reports of cases of poliomyelitis for the periods indicated have been received from the division of public health methods, U. S. Public Health Service:

Deaths

M. Herbert Barker ⊕ Chicago; born in Villisca, Iowa, Aug. 20, 1899; Rush Medical College, Chicago, 1926; master of science in physiology at Northwestern University in 1930; associate professor of medicine and in charge of the cardiorenal vascular disease clinic and laboratory at Northwestern University Medical School; specialist certified by the American Board of Internal Medicine; interned at the Wesley Memorial Hospital; at one time resident at the Peter Bent Brigham Hospital and at Children's Hospital, Boston; on the attending staff of the Passavant Memorial Hospital, Chicago; member of the American Medical Association, Chicago Society of Internal Medicine, Central Society of Clinical Research, Central Clinical Research Club and the Chicago Society of Medical History; chairman of the peripheral vascular section of the American Heart Association; founding member of the American Society for the Study of Arteriosclerosis; fellow of the American College of Physicians; at one time consultant in cardiorenal disease at the Veterans Diagnostic Center, Edward Hines Hospital; member of the advisory counsel of the Illinois State Pneumonia Control Board; chairman of the Committee for Nomenclature of Renal Vascular Disease; regional consultant for the Surgeon General of the Army; entered the medical corps, Army of the United States, as a lieutenant colonel in February 1942; sent overseas in December 1942; later promoted to colonel; consultant for the Allied Forces in the Mediterranean theater; in 1945 was awarded the Legion of Merit for his work on infectious hepatitis; enlisted as a private in the Marine Corps in 1918; died while visiting patients at the Passavant Memorial Hospital, August 14, aged 47, of ruptured congenital cerebral aneurysm.

Marcus Neustaedter, New York; born in Austria in 1871; Bellevue Hospital Medical College, New York, 1896; received Ph.D. from New York University in 1906; member of the American Medical Association, New York Academy of Medicine, New York Neurological Society and the Society for Research in Neurology; formerly clinical professor of neurology at the New York Polyclinic Medical School and Hospital; served as instructor and lecturer in neurology from 1906 to 1920 and later clinical neurologist at the University and Bellevue Hospital Medical College; for many years visiting neurologic director of service and president of the medical board of the Central Neurological Hospital of Welfare Island; since 1925 consulting neurologist of the New York Cancer Institute; formerly on the staff of the Kings County Hospital in Brooklyn and St. Mark's Hospital; member of the appeal board of the medical corps during World War I; author of numerous papers on [illegible] encephalitis and a "Textbook of [illegible] ents and Practitioners"; died in [illegible] Hospital June 17, aged 76, of heart disease.

James Robert Judd ⊕ Honolulu, Hawaii; born in Honolulu May 20, 1876; Columbia University College of Physicians and Surgeons, New York, 1901; member of the Pacific Coast Surgical Association; fellow of the American College of Surgeons; past president of the Hawaii Territorial Medical Society and vice president of the Pan-Pacific Surgical Association; formerly member of the board of health; assistant to the American National Red Cross during the Spanish-American War; received the Legion of Honor from the French government in 1920 for his work with the American Ambulance Corps in France in 1915 and 1916; chief of the surgical staff of Queen's Hospital; died June 2, aged 71.

Benjamin G. Argabrite, Greenville, Ky.; University of Louisville Medical Department, 1907; veteran of the Spanish-American War; died June 9, aged 71, of coronary thrombosis.

James Harold Beckley ⊕ Nanticoke, Pa.; Jefferson Medical College of Philadelphia, 1926; member of the school board; served on the staffs of the Wilkes-Barre (Pa.) General Hospital and the Nanticoke (Pa.) State Hospital; served for a short time as a captain in the medical corps, Army of the United States, during World War II; died in Hunloch Creek June 1, aged 44, of coronary embolism and acute myocarditis.

Ivan Estle Bennett, Elgin, Ore.; University of Oregon Medical School, Portland, 1931; member of the American Medical Association; died May 15, aged 45.

Charles A. Boterf, Hartford, Kan.; University Medical College of Kansas City, Mo., 1907; died May 17, aged 80, of heart disease.

Andrew J. Byerly, Hornick, Iowa; State University of Iowa College of Medicine, Iowa City, 1887; served as mayor; affiliated with the Methodist and St. Joseph's hospitals in Sioux City; died June 3, aged 86.

Ovide Toussaint Charron, New Bedford, Mass.; College of Physicians and Surgeons, Boston, 1912; served as city physician; affiliated with the Acushnet and Union hospitals; died May 26, aged 64, of angina pectoris.

Charles Michael Collins, Providence, R. I.; University of Maryland School of Medicine, Baltimore, 1910; served during World War I; formerly on the staff of St. Joseph's Hospital; died in the Veterans Hospital in Bedford, Mass., May 8, aged 63.

Frank Augustus Cowles, Beverly, Mass.; University of the City of New York Medical Department, 1881; served as city physician and on the staff of the Beverly Hospital; died May 21, aged 87.

George G. Craig, Rock Island, Ill.; Northwestern University Medical School, Chicago, 1898; member of the American Medical Association; died May 26, aged 71.

Charles Elbert Davis, Los Angeles; Northwestern University Medical School, Chicago, 1898; served during World War I; died May 17, aged 71.

Charles August Dettman, Wallace, Idaho; Milwaukee Medical College, 1905; died April 22, aged 67.

Stanley Randolph Milward Gordon, Kingston, Jamaica, B. W. I.; Howard University College of Medicine, Washington, D. C., 1928; served during World War I; assistant surgeon at the Kingston Hospital; died in St. Andrew June 24, aged 56, of myocarditis and hypertension.

Charles Edward Harris, Hyannis, Mass.; Baltimore Medical College, 1897; member of the American Medical Association; served during World War I; captain, medical reserve corps, not on active duty; past president of the Hyannis Free Public Library Association; affiliated with the Cape Cod Hospital, where he died May 21, aged 78

Edwin W. Janes ⊕ Tacoma, Wash.; University of Buffalo School of Medicine, 1898; member of the North Pacific Society of Internal Medicine; at one time city health director; past president of the Pierce County Medical Society; served during World War I; consulting physician at the Veterans Administration Hospital in American Lake; died May 27, aged 73.

Charles Willard Lynn, Hollis, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1899; formerly a member of the New York City Health Department, which he served first as a school medical inspector and then as assistant registrar of records in Queens County; served during World War I; died in Bradenton, Fla., June 3, aged 68, of coronary thrombosis and arteriosclerosis.

Charles Wesley More ⊕ Eveleth, Minn.; Chicago Medical College, 1888; fellow of the American College of Surgeons; served as a member of the state board of health, library board and school board; formerly health officer; member of the draft board during World War I; active in the Minnesota State Hospital Association; for many years owned the More Hospital; died June 1, aged 86, of cerebral hemorrhage.

Ernest Alfred Purnell ⊕ Granite City, Ill.; University of Michigan Homeopathic Medical School, Ann Arbor, 1909; served during World War I; on the staff of St. Elizabeth Hospital; died May 30, aged 61, of coronary thrombosis.

Josef Adam Radzievich, Minersville, Pa.; Georgetown University School of Medicine, Washington, D. C., 1931; member of the American Medical Association; on the staff of the A. C. Milliken Hospital in Pottsville; died in the Graduate Hospital of the University of Pennsylvania in Philadelphia, May 27, aged 43.

Albert Adam Ripperger, New York; Ludwig-Maximilians-Universität Medizinische Fakultät, Munich, Bavaria, Germany, 1893; died May 21, aged 85.

John Bartlett Ross, Chicago; Dearborn Medical College, Chicago, 1905; member of the American Medical Association; affiliated with the American Hospital, where he died June 4, aged 76, of papilloma of the bladder.

Franklin William Shaffer, Colorado Springs, Colo.; (licensed in Kansas in 1901); died May 13, aged 76.

Claude Gibony Spears, Altus, Okla.; Fort Worth School of Medicine, Medical Department of Fort Worth University, 1902; member of the American Medical Association; for many years county health officer; served as a member of the city council; died May 21, aged 73, of coronary occlusion.

George Reed Tabor, Tishomingo, Okla.; Louisville (Ky.) Medical College, 1888; member of the American Medical Association; formerly state health officer of Texas and on the faculty of the Baylor University College of Medicine in Dallas; at one time surgeon general of the Texas National Guard; died May 19, aged 82, of heart disease.

General Practitioner Obstetricians

Whatever views are held about the National Health Service, one thing cannot be disputed: it will mean revolutionary changes in the practice of medicine. A striking example is the institution of a new order of practitioners with the new designation "general practitioner obstetricians." In a circular issued by the Ministry of Health it is announced that the maternity hospitals and homes now maintained by many welfare authorities will be transferred to the minister of health; specialist services will be made available by the regional hospital boards, and the services of a family doctor will be available to every expecting or nursing mother, as well as to every child. The minister proposes that certain medical practitioners in each district shall be selected to practice midwifery and called "general practitioner obstetricians." Every general practitioner will be given an opportunity to say whether or not he desires to practice midwifery under the act and to answer calls by midwives for medical aid. The experience of the practitioners who desire to do so will be reviewed by a local *ad hoc* committee of a wholly professional character, consisting of local general practitioners, a consulting obstetrician and the local health officer. This committee will draw up a list of local approved practitioners and will be entitled to indicate to those not accepted the need for further obstetric experience. The list will be reviewed from time to time to ensure that doctors on it are continuing to undertake enough midwifery to remain competent in practice and to add the names of future entrants to the profession as they acquire the necessary experience. The duty of a family doctor, when consulted by a woman who is pregnant, will be to see that she knows how to obtain the services of a midwife and, if he himself is not on the local approved list, to help the woman to choose a "general practitioner" from the approved list who will give her the necessary antepartum and postpartum care and will be present, if he thinks it necessary, or is called by the midwife, at the confinement. An inclusive fee for general practitioner obstetricians additional to that payable for other general medical services will be centrally negotiated with the profession. The general practitioner obstetricians, with the selected officers of the local health authority, the midwives and a consultant obstetrician, will form composite teams in each area. In time the general practitioner obstetricians will no doubt provide the bulk, if not the whole, of the medical staff for the local health authority's antepartum clinics, at which consultative clinics will also be held by the specialist obstetricians.

Incidence of Venereal Disease in the Army

When the second reading of the National Service Bill, which imposes conscription for the armed forces, was moved in the House of Lords the discussion was confined to the incidence of venereal disease in the army. The archbishop of York referred to the temptation to which young soldiers serving in Germany were exposed. In the British zone there were several million young women in excess of the number of men. Some of them, because of the circumstances of the Hitler régime, were oversexed. He pleaded that conscripts should be kept in England a considerable time before being sent to Germany. Lord Moran, president of the Royal College of Physicians, gave alarming figures of the incidence of venereal disease in the army. In September last for every thousand men in our army in Japan 228 had venereal disease. In the army in Germany the figure was 185, in Austria and Italy 168, in Burma and Malay 141. In the Middle East the figure was only 31, but this was due to the fact that there was really no mixing between the army and the civil population. For the army at home the figure was 33 per thousand. That was much higher than usual; it was generally in the neighborhood of 12. In the civil population the figure for syphilis worked out about 5 or 6 per thousand. The same prevalence of venereal disease existed in 1919 after the first world war. Then the figure was 150 out of every thousand in the army of the Rhine, while in the American army in September of that year, of all the white American troops in Germany and France, 859 out of every thousand had venereal disease. He quoted from volume xv of Medical and Casualty Statistics. Absence from home was the factor which led to this high incidence. The longer a conscript was away, the higher the incidence of venereal disease. These figures lent no support to the prime minister's idea that the army was a people's university.

For the government Lord Nathan said he was staggered at Lord Moran's figures and questioned them. The highest figure for the United Kingdom forces in the third quarter of 1946 was 9.6 per thousand. In the British army on the Rhine the highest figure was in the third quarter of 1946, 44.6 per thousand. Lord Moran replied that he had quoted from official reports. The discrepancy appeared to be due to the fact that he had given an annual rate while Lord Nathan gave a quarterly one. His figure of 228 meant that number on an annual rate. His figures had been given by the army medical department.

Toxicologic Investigation After 177 Years: The Death of Chatterton

A discovery throwing fresh light on the death of the boy poet Thomas Chatterton has been made after a hundred and seventy-seven years by Dr. H. J. Walls, staff chemist of the government forensic science laboratory of the southwest region. This boy, whom posterity has pronounced a genius, committed suicide by taking arsenic on Aug. 24, 1770, at the age of 17 years. He was penniless and starving because his literary efforts were so ill rewarded. In the Bristol Museum was the pocketbook found in his possession at the time of his death. On the book was a large stain running through six or seven pages. This on analysis has been definitely identified as opium, confirming the belief that Chatterton took the drug to alleviate his suffering, either before or immediately after taking the arsenic. Thus, in the words of Dr. Garnett, was destroyed "the most extraordinary literary phenomenon that the world ever saw."

Problem Girls

A joint committee of the British Medical Association and the Magistrates Association has issued a report on their investigation of "problem girls"—girls usually between the ages of 13 and 17 who appear before the courts on charges of stealing or because they are beyond control, in moral danger, or in need of protection or care. Superficially they may be described as "good time girls"—living only for their own enjoyment, morally and emotionally unstable, perhaps guilty of sexual misbehavior and unamenable to discipline and control. They present a serious social problem which is far from satisfactorily handled. Investigation reveals that usually their misbehavior is the result of interaction between temperament and environment, but always at the root is some defect of character. The war must take its share of responsibility. Evacuation from home and sleeping in shelters may often have provided temptations. But there has also been a slackening of adult moral standards. The committee finds that the present methods of handling these cases is more likely to increase than diminish the tendency toward misconduct. There must be fuller recognition of the nature and causes of misbehavior and the objects of treatment, more facilities and skilled staff for investigation and treatment and more clinics and institutions for treatment.

Wild Animals and the Control of Disease

Africa is presenting, by reason of its wild animals, special health problems. Nearly half the continent was represented at a conference on fauna of the British dominion and colonial territories. The effect of the method used for exterminating the fly Glossina morsitans, the carrier of Rhodesian sleeping sickness, by eradication of the large fauna on which the fly preys came under criticism, because this did not eliminate other species which had an equal or greater importance. The method of fly destruction should therefore be tested under more varied conditions. It was thought that alternative and better methods might emerge from present experiments, including bush clearing and the large scale use of insecticides. In any event the destruction of game should be undertaken by experts. In view of the part played by wild animals in spreading disease, the conference favored veterinary control of game areas. Biologists should be appointed to game departments. In view of the importance of carnivora in maintaining the balance of nature, the conference agreed that protection of the lion, the leopard and the cheetah should be given early consideration.

Increase of Infantile Paralysis

A serious increase in the number of cases of infantile paralysis has taken place. Since the beginning of the year up to July 5, 435 cases have been reported in England and Wales, as compared with 206 in the same period of 1946. For the week ended July 12, 110 new cases were reported, bringing the total since the beginning of the year up to 545. In the same period of last year the total was 218. In London there are 21 cases in hospitals. In Lewisham, a borough in the southeast of the metropolis, swimming galas have been canceled because of 9 cases, 2 of which were fatal. At Watford, a town near London, a woman aged 25, recently demobilized from the army, has died from the disease after being a week in a respirator. Other fatal cases are reported from various parts of the country.

$200,000 for Hematologic Research

The Nuffield Trust has offered $200,000 to the University of Oxford to be paid over a period of ten years to meet the capital and maintenance costs of a hematologic research unit. This will be established in the medical school in conjunction with the Nuffield Department of Clinical Medicine and the Radcliffe Department of Pathology.

ITALY

(From Our Regular Correspondent)

Florence, April 30, 1947.

Problems with the Mutual Assistance Funds

There is going on among the physicians in Italy some agitation against the mutual assistance funds for diseases with regard to the renewal of the agreements. The physicians would like to have the regulations modified and improved and more adequate prices agreed to. In addition there was the project of making the insurance service for occupational disease which has a definitely social character an obligatory one for the health officers in general and for the municipal physicians in particular.

The agreements which expired on Dec. 31, 1946 were denounced for the entire country by the medical ranks and by the health associations, which reserved for themselves complete liberty of action beginning Jan. 1, 1947. Attempts were initiated to dispose of the differences between the provincial ranks of the physicians and the National Institute of Assistance for Occupational Diseases, on which the mutual assistance funds depend, but satisfactory agreements were reached only in a few Italian provinces, while in others, and they are the great majority, the discussions have become constantly more violent.

The president of the federation of the medical ranks who intervened with the assistance of the High Commissary for Hygiene and Public Health succeeded so far that the project concerning the obligatory social service of the physicians will be submitted to examination by the legislative assembly.

After various vicissitudes a commission was nominated with the undersecretary of state for the minister of labor as chairman and with delegates from the interested parties. The commission approved some principles, among them free choice of physician, with the agreement that the ranks will compile an appropriate index of physicians who will join liberally the mutualistic service. Furthermore, it was decided that the crop sharing farmers will be considered private clients in the expectation that new laws will settle the particular position of these laborers. The problem of the crop sharing farmers was of considerable interest to some federations of physicians in northern Italy, and particularly in the province of Piedmont. During the year 1947 there will be no verification of any new category of persons entitled to mutual assistance.

After earnest discussions as to new rates of compensation an agreement was reached with regard to the maximum, which on the average was settled as 160 lire per person and for every visit, while the tariff of 1940 for ambulatory patients was raised ten times. This modus vivendi was established by the commission for the entire year 1947 but was regarded with distrust and little satisfaction by many Italian physicians, who consider such agreements only as a truce in the expectation of new battles.

Influence of the War on Maternity

At a meeting of the Società Triveneta di Ostetricia e Ginecologia, Professor A. Martinelli presented observations and statistics from the obstetric school of Verona on the effect of the war period on maternity. During the war the median weight of the fetus at term was 0.3 per cent lower than that of the prewar period. There was a mild increase in the number of premature births and of abortions. The mortality of the newborn increased also during the last five year period, while toxicosis of pregnancy and eclampsia were definitely reduced, as they were according to observations during World War I. There were no changes in dystocia, while the morbidity of the puerperium was increased. The maternal mortality was reduced. The birth rate was reduced in some communities during the war, as for instance in Verona, where the natality was less than half of the prewar natality.

Dr. De Marchi and Dr. Barazzueli have studied likewise the effect of the war on reproduction. Considering the behavior of the median weight of newborn infants from physiologic pregnancies at the obstetric-gynecologic clinic of the University of Padua during the last decade, the speakers demonstrated that the yearly median weight had decreased progressively during the last five years with values of 3,325 Gm. in 1940 to values of 3,190 Gm. in 1944. They investigated such other factors as the sex of the newborn, the age of the mothers and the civil state of the mothers. The speakers showed that in 1940 the values of the yearly median weight of the fetus reached 3,524 Gm. in multiparas, 3,377 Gm. in primiparas, 3,591 Gm. in the married, 3,388 Gm. in the unmarried, 3,538 Gm. in the male, 3,400 Gm. in the female, 3,441 Gm. in mothers between the ages of 15 to 30 years, 3,518 Gm. in mothers between the ages of 31 to 40 years and 3,540 Gm. in mothers over 40 years of age. Since 1940 all the corresponding values have decreased and the minimum weight during the years 1944 to 1945 revealed an average decrease of 5.09 per cent. The conclusions drawn from these studies on fluctuations of the weight of the fetus are as follows: Since all the factors examined show a uniform behavior, the phenomenon of the reduction of the median weight of the fetus during the last quinquennium must be due to specific causes such as undernourishment, physical and psychic trauma and in general the privations associated with war.

Recurrence of Relapsing Fever

For about twenty years there have been no cases of relapsing fever in Turkey, but in November and December 1946 isolated cases of recurrent fever occurred in the southeastern province of Diyarbakir. Immediate preventive measures held the incidence to 20, 17 being among civilian refugees coming from Persia and 3 among the army.

The Ministry of Health immediately ordered physical examination of all people coming from that area and blood examination of all suspects. Prof. Dr. Tevfik Saglam of the Istanbul University, an authority on relapsing fever in Turkey, made it the subject of a lecture to the interns and students of the third medical clinic.

After a general review of the character of the disease, the professor, who had been chief medical officer of the third Turkish army at the Caucasian frontier during the first world war, told of his experience and observations with regard to the relapsing fever epidemic that had already made its appearance at the beginning of the war. The only statistics available for the first few months are these:

	Cases	Deaths
November 1914	38	2
December 1914	167	72
January 1915	223	121

The professor is of the opinion that these figures are much too low, since 2,102 cases of relapsing fever with a fatality rate of 29 per cent had come to his personal attention in March 1915. All these cases were of the louse borne type caused by Spirocheta obermeieri and responded to treatment with neoarsphenamine. Preventive measures had little effect at first. The epidemics reached their peak in 1915. Rigorous preventive measures brought the outbreak down gradually during the following years. The relapsing fever figures for the third Turkish army, Caucasian front, are as follows:

	Cases	Deaths	Fatality Rate, per Cent
1915 (10 months)	16,600	4,678	28.2
1916	8,382	1,592	18.9
1917	3,821	453	11.9
1918 (9 months)	1,095	50	4.5
43 months	29,898	6,773	22.3

Of all hospitalized army members during the forty-three months of the first world war relapsing fever represented a ratio of 4.7 per cent, with a death rate of 6.04 per cent. However, all other Turkish armies from the first to the ninth were equally affected on all fronts, the incidence being:

	Cases	Deaths	Fatality Rate, per Cent
1914	1,595	236	14.8
1915	27,511	6,479	23.9
1916	25,520	4,508	17.6
1917	18,808	2,477	13.1
1918	15,081	1,637	10.8
	88,515	15,337	17.3

During the war of independence, relapsing fever epidemics also affected the armies, the figures for this period being:

	Cases	Deaths	Fatality Rate, per Cent
1920	325	3	0.9
1921	2,268	71	3.1
1922	3,905	202	5.6
1923	114	2	1.7
	6,612	278	4.1

During this period relapsing fever represents a ratio of 5.6 per cent, with a death rate of 6.2 per cent.

Professor Saglam gave a survey of epidemics in other parts of the world, discussed the different forms of the disease and its vectors, and in conclusion stressed early preventive measures, early diagnosis and early treatment.

The Progressive Anoxia Test

Dr. J. Fernández Noguera, head, Metabolimetry and Spirometry Department, Madrid Faculty of Medicine, and assistant professor of endocrinology in the university chair of Professor Marañon, has done some interesting work. He previously worked on the problem of gas reexchanges and on the function of the lungs during periods of fasting (*Rev. clin. española* 8:398, 1943), observing that underfed patients in Madrid suffered from a deficient saturation of arterial blood with oxygen.

In 1945 he reported a technic for the functional examination of the oxygen system (Breathing in Rarefied Atmospheres: Its Application as a Functional Test, *Revista española de tuberculosis* **14**:447 [July] 1945). The object was to find a simple test which would show the adaptation capacity of the respiratory system. The technic which he suggested consists in having the patient breathe an atmosphere the partial oxygen tension of which is gradually rarefied so that in seven to ten minutes he reaches critical figures at which hematosis cannot be normally verified (the oxygen level, as a general rule, in healthy subjects, corresponding to 50 to 80 mm. of mercury).

During the test the oxygen percentage and partial tension are known at every moment and the following data are recorded from minute to minute: the depth and frequency of breathing, the oxygen consumption, the pulse frequency and tension, the electrocardiogram and the appearance of dyspnea and anoxemia; when the last-named symptom appears or cyanosis begins, the test is considered ended.

In practice the author uses a Knipping spirograph specially adapted for the purpose (although the test can, without difficulty, be carried out with other apparatus) combining pump circulation, absence of valves and rapid and sure absorption of carbon anhydride.

The test has given satisfactory results in clinical practice and is free from danger if carefully handled, avoiding, particularly in cardiac patients, the setting up of critical tensions surpassing the reserve strength of the circulation and breathing.

Use of the test on a series of healthy subjects of both sexes has given sufficiently concurrent results to serve as references for the classification of pathologic cases (*Boletin d. Inst. de patol. med.* **1**:104, 1946).

At the suggestion of Dr. Marañon, the test was used in a series of hyperthyroid and hypothyroid cases. The matter had already been noted by other authors in clinical practice and also in experiments on animals (Du Quervain, Asher, Binet), but no other technic had made a quantitative evaluation of this phenomenon. The results as reported by the author before the Institute of Medical Pathology directed by Professor Marañon in the Madrid General Hospital, and published in volume 7 of the *Trabajos del Instituto Nacional de Ciencias Medicas*, show that, while in thyrotoxicosis there is intolerance of anoxia, in hypothyroidism the contrary occurs and high grades of anoxemia can be reached with hardly any reaction, either subjective or objective, being produced.

Although there is some relation between this abnormal reaction and the degree of basal metabolism deviation, this is also a somewhat specific fact which enables one to draw clinical conclusions, for the author has had occasion to appreciate that several patients with very low metabolism not due to thyroid trouble behaved during the test in a very different way from those with hypothyroidism. Recently in an 11 year old child suffering from ichthyosis, whose basal metabolism was —22 per cent and whose condition did not yield to thyroidin, a diagnosis of hypothyroidism could almost certainly be discarded (although certain clinical aspects of the case led to a suspicion of this condition) owing to the child's intolerance of progressive anoxia. Various practical applications of this test have been made.

Correspondence

THE LARGEST ORGAN

To the Editor:—In the article entitled "Modern Physiologic Concepts: Their Application to the Treatment of Diseases of the Liver," in The Journal June 14, Dr. James F. Weir states "The liver, which is the largest organ in the body . . ." This is erroneous.

An organ is defined as any part of the body having a special function. With this definition, at least one organ, the brain, is just about equal to the liver in weight and at least one other, the skin, is much larger. If we include still other systemized tissues such as bone, muscle and blood, the order of size of organs in weight becomes (1) skeleton, (2) musculature, (3) blood, (4) skin, (5 and 6) liver, brain. Perhaps the skeleton, musculature and blood are not commonly thought of as organs, although there are no good reasons why they should not be so considered, but certainly the skin, liver and brain are entirely comparable.

The average weight of the human liver is 1,200 to 1,600 Gm. The average weight of the human brain is 1,360 Gm. The average weight of the skin is between two and three times greater than either. The weight of the skin cannot be derived exactly by dissection and the use of scales as can be done for the other organs, but it *can* be computed. The result of computation is approximate, but since the answer is double to treble the figures with which it is to be compared and since the margin of error is much less than twice or thrice, the conclusion is valid.

The formulas and calculations for the weight of the skin are as follows:

Area of skin in sq. cm. = (Body weight in Kg.) $^{0.425}$ × (Height in cm.) $^{0.725}$ × 71.84
Volume of skin in cc. = Area of skin in sq. cm. × Thickness in cm.
Weight of skin in Gm. = Volume in cc. × Specific gravity of skin

Solving these simple equations with use of average values yields results of these magnitudes:

Area of the human skin = 16,000 to 18,500 sq. cm.
Volume of the human skin = 2,400 to 2,800 cc.
Weight of the human skin = 3,000 to 3,500 Gm.

Morris Leider, M.D., Brooklyn.

STANDARD GELATINS AVAILABLE FOR EXPERIMENTAL USE

To the Editor:—Much experimental work has been performed with gelatins of unknown or unspecified properties. This has detracted from the value of the investigations, since the work could not be duplicated or extended, owing to the inability to procure gelatin with identical physicochemical or biochemical characteristics.

Two commercial types of gelatin are available, depending on the process by which different sources of collagen are treated for conversion into gelatin. Type A is made from an acid treated precursor (usually porkskin) and possesses a normal p_H of 3.8 to 4.5 and an isoelectric point in the range of p_H 7.0 to 8.3. Type B is made from an alkali (lime) treated precursor (usually bone-ossein or calfskin) and possesses a normal p_H of 5.0 to 7.0 and an isoelectric point in the range of p_H 4.7 to 5.0.

Physicochemical qualities such as swelling, stabilizing and chemical combination vary with the properties. Biochemical properties will depend in addition on the technic of preparing any particular types of gelatin. For example, antigenicity, nonpyrogenicity, degree of sterility or biologic tolerance are factors which must be controlled and tested for in each specific lot as it is produced.

The Edible Gelatin Manufacturers' Research Society will furnish samples together with complete information and specifications relating to any particular problem. It will endeavor through member organizations and laboratories to help with the characterization of any gelatin preparation which may need to be duplicated in the interest of research and development studies.

The following types of gelatin are available:

Type A, graded by gel strength as specified.
Type B, graded by gel strength as specified.
Type A (special), nonantigenic, nonpyrogenic.
Type B (special), nonantigenic, nonpyrogenic.
Type A, U. S. P. Pharmagel A.
Type B, U. S. P. Pharmagel B.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

BOARDS OF MEDICAL EXAMINERS
BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of the boards of medical examiners and boards of examiners in the basic sciences were published in The Journal Aug. 9, page 1262.

NATIONAL BOARD OF MEDICAL EXAMINERS

National Board of Medical Examiners: *Parts I and II.* Various centers, Sept. 15-17. *Part III.* Durham, N. C., Oct. 21-23. Exec. Sec., Mr. Everett S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

American Board of Anesthesiology: Part II. *Oral.* Cleveland, Oct. 5-11. Sec., Dr. P. M. Wood, 745 Fifth Ave., New York 22.

American Board of Dermatology and Syphilology: *Part II. Written.* Various centers, Sept. 15. Sec., Dr. G. M. Lewis, 66 E. 66th St., New York 21.

American Board of Internal Medicine: *Oral.* Chicago, Oct. 8-10. Asst. Sec., Dr. W. A. Werrell, 1 West Main St., Madison 3.

American Board of Neurological Surgery: *Oral.* Chicago, May or June. Final date for filing application is Feb. 1. Sec., Dr. W. J. German, 310 Cedar St., New Haven, Conn.

American Board of Obstetrics and Gynecology: *Part I. Written.* Various Centers, Feb. 6. Final date for filing application is Nov. 1. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh 6.

American Board of Ophthalmology: Chicago, Oct. 6-12. Sec., Dr. S. Judd Beach, 704 Congress St., Portland, Me.

American Board of Orthopaedic Surgery: Part II. Chicago, Jan. 22-23. Final date for filing applications is Sept. 15. Sec., Dr. F. M. McKeever, 1136 W. Sixth St., Los Angeles 14.

American Board of Otolaryngology: Chicago, Oct. 7-11. Sec., Dr. D. M. Lierle, University Hospitals, Iowa City.

American Board of Pathology: Chicago, Oct. 24-25. Final date for filing application is Sept. 15. Sec., Dr. Robert A. Moore, Euclid Ave. and Kingshighway, St. Louis 10.

American Board of Pediatrics: Dallas, Dec. 5-7. Philadelphia, Jan. 9-11. Sec., Dr. Lee F. Hill, 718 Royal Union Bldg., Des Moines 9.

American Board of Plastic Surgery: Examinations are given in April and November of each year in the home town of applicants. Sec., Dr. Louis T. Byars, 508 N. Grand Blvd., St. Louis.

American Board of Psychiatry and Neurology: *Oral.* New York, December. Final date for filing application is Sept. 15. Sec., Dr. Francis J. Braceland, 102-110 Second Ave., S. W., Rochester, Minn.

American Board of Surgery: *Written.* Various Centers, March. Final date for filing application is Dec. 1. Sec., Dr. J. S. Rodman, 225 S. 15th St., Philadelphia 2.

American Board of Urology: Chicago, February. Final date for filing application is Nov. 1. Sec., Dr. Harry Culver, 1409 Willow St., Minneapolis 4.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Medical Practice Acts: What Constitutes Disapproval of Medical School.—Aarons, Burroughs and Mann filed separate mandamus proceedings against the Board of Medical Examiners of the State of California. Aarons sought to compel the board to admit him to the written examination; Burroughs and Mann sought to compel the issuance to them of reciprocity certificates without examinations. All three cases were tried together on the same record and all three resulted in judgments for the petitioners. The Board of Medical Examiners accordingly appealed to the district court of appeals, first district, division 2, California.

Section 2310 of the Medical Practice Act of California provides: "The Board shall issue a reciprocity certificate to an *applicant to practice a system or mode of treating the sick* or afflicted in this state that he is authorized to practice in any other state if it is a system or mode that is recognized by this chapter or by any preceding practice act. Subject to the provisions of sections 2320 and 2321, no examination for any reciprocity certificate shall be required." The qualification found in the last sentence naturally directs the inquiry to section 2320, which reads as follows: "The board may make an independent investigation of the educational qualifications and the character, ability and standing of the applicant. If, after this investigation and any other or further examination or investigation which the board may see fit to make on its own part, it is found that the requirements of the medical licensing authority issuing his certificate were in any degree or particular less than the requirements provided by the law of this state at the date of the issuance of his certificate . . . he will not be entitled to practice in this state without an examination." Section 2321 provides that if the out of state license is more than 10 years old the candidate must take an oral examination. When sections 2310 and 2320 are read together they must necessarily mean that if the candidate measured up, in his own state, to California's requirements—one of which is graduation from a school approved by the California board—then he should be admitted without examination, but if he did not, he must submit to an examination. The fact that an examination is called for must necessarily mean that the requirements of the other state have been found to be below those of California. Certification after an examination so required cannot possibly amount to approval of the applicant's school.

The three petitioners were graduates of the Chicago Medical College, which was disapproved by the defendant board by a resolution dated Feb. 18, 1924 and such action has never been rescinded. To surmount this barrier, counsel for the petitioners drew the board's attention to the fact—disclosed, of course, by its own records—that (despite such formal disapproval) at least nine graduates of the same school had been granted certificates by the board. The theory on which the mandate proceedings in the trial court were commenced, and the theory of the petitioners on appeal, is that what the board did in admitting nine graduates of the same school outweighed and nullified what it said in the resolutions of disapproval and amounted to de facto approval of the school.

Of the nine instances referred to by the petitioners wherein graduates of the Chicago Medical College had been admitted to practice in California, only two were admitted without examination. One of these was admitted under compulsion of a court mandate, said the District Court, and such action under such circumstances cannot be characterized as an approval of the school. The other was admitted without examination on resolution of the board. He had graduated from the Chicago Medical College in 1923 and, as noted, the board's resolution of disapproval of the college was dated 1924.

The petitioners also contend that an approval of the school may be implied from the wording of the board's directories. Instead of approval, the directories, in our opinion, said the court, definitely show disapproval. The 1945 directory contains a list of medical schools both existing and extinct. It announces that existing recognized schools are in black faced type. Schools in light face type are extinct, have merged with other schools or are not recognized." Under Illinois, forty-five schools are listed. Five of these are shown in black faced type, meaning approved. Of the remaining forty, sixteen—including the school in question—are listed not only in light faced type but with the designation "reported not acceptable for licensure by many of the state licensing boards, or not approved as a medical school by the Council on Medical Education of the American Medical Association." This, concluded the District Court of Appeals, certainly does not indicate approval.

At the trial the board offered in evidence its minutes of June 30, 1927, wherein by resolution the board disapproved the school for the second time. The petitioners objected that the resolution had not been called to the board's attention or introduced in evidence, so to speak, at the informal hearing which the board accorded to petitioners, and the objection was sustained. We have no doubt that the ruling was erroneous, said the District Court of Appeals. The resolution was contained in the board's minutes and was certainly within its own knowledge. The principal, if not the only, question in the case is whether there had been approval or disapproval of the school. The resolution tended to disprove petitioner's allegations and to prove those of the board on that issue. The first resolution, of Feb. 18, 1924, had been admitted and the second resolution was just as admissible as the first. These resolutions showed two formal actions by the board disapproving the school. Manifestly such formal and deliberate actions of the board, to whom the legislature had committed the important duty and function of approving or disapproving medical schools, should not be subject to nullification by less formal or deliberate action except by the strongest kind of showing. The evidence relied on to establish such nullifications should be clear, convincing and unequivocal. Such proof was not forthcoming in this case, and we are constrained to hold that there is no substantial evidence in this record to sustain the findings that the school had been approved.

Another contention of the petitioners was that the board's action was arbitrary, capricious, discriminatory and violated his constitutional rights. To support this contention petitioners quoted from *Hewitt* v. *State Board of Medical Examiners*, 148 California 590, 84 P. 39, the familiar statement that "the right to practice medicine is, like the right to practice any other profession, a valuable property right, in which, under the Constitution and laws of the state, one is entitled to be protected and secured." However true that is, said the district court of appeals, it must be borne in mind that that language was used in respect to a license which had been already issued and was outstanding, not one which was then only applied for. In Re Investigation of Conduct of Examination for Admission to Practice Law, 1 Cal. (2d) 61, 33 P. (2d) 829, the court, after commenting on the "mistaken conception" that there exists "a 'vested right' to practice law," says "It has been the rule in this state . . . that 'the right to practice law is not an absolute right derived from the law of nature. It is the mere creature of the statute, and when the license is issued and the official oath taken, which authorizes the attorney to exercise the right, it confers but a statutory privilege, subject to the control of the legislature.' . . ." That declaration, said the court of appeals, of course applies with equal right to the practice of medicine.

Other points raised by the petitioners were also overruled and the judgments of the trial court were reversed with directions to dismiss the mandate proceedings.—*Aarons v. Board of Medical Examiners, 176 P. (2d) 706 (Calif., 1947); Mann v. Board of Medical Examiners, 176 P. (2d) 708 (Calif., 1947); Burroughs v. Board of Medical Examiners, 176 P. (2d) 715 (Calif., 1947).*

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1937 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Cutaneous Tests and Immunization in Diphtheria and Scarlet Fever.—All student nurses who enter contagious service at Cleveland City Hospital are given Schick and Dick tests routinely. Those who have positive reactions are immunized against the antigen to which they are susceptible. In a twenty year period nearly 50 per cent of a group of student nurses were found to give positive reactions to the Schick test. Neither the density of population of the area they came from nor the fact that some had had diphtheria significantly altered the rate of positivity. Alum precipitated toxoid was found to be the best immunizing agent against diphtheria in these young adults. In over 6,500 Dick tests on student nurses, 38.9 per cent of the reactions were positive. Persons from smaller towns had a higher percentage of negative reactions than did persons from Cleveland hospitals. Persons who had had scarlet fever had a higher rate of negative reactions than those who had not had scarlet fever. The Dick test is a good but not perfect indicator of immunity to scarlet fever. Immunization with Dick toxin was 89.1 per cent effective in that the cutaneous test was reversed. Reactions were observed in 28.7 per cent of those immunized. Some reactions were serious, but most were local.

Frequency of Encephalitis as Complication of Measles.—According to Hoyne and Slotkowski it is difficult to determine the exact incidence of measles encephalitis because not all cases of measles are reported and many cases of mild encephalitis may be missed. The series of 20 cases reviewed makes a ratio of 1 to 642 on the basis of cases of measles reported in Chicago. If 10 additional cases are included, 3 of which were fatal and were observed by one of the authors at Municipal Contagious Hospital, the ratio for 30 cases of encephalitis becomes 1 in 428 reported cases of measles. This seems to be the highest incidence for measles encephalitis that has been reported. A table which lists the incidence arrived at by other investigators indicates that this complication develops in less than 1 per thousand cases. One author arrived at an incidence of only 1 in 15,000 cases. Of the 20 cases of measles encephalitis analyzed by the authors, 2 ended fatally soon after admission and another after transfer to a private hospital. The mortality rate in these 20 cases amounted to 15 per cent. Complete recovery occurred in 16 of the remaining 17 cases, whereas some muscular spasticity and incoordination remained in 1 case on dismissal from the hospital. Encephalitis is an early complication and rarely occurs after the rash of measles has disappeared. It is much commoner after 5 years than before. Negroes are likely to escape this complication entirely. Even in extremely severe attacks complete mental as well as physical recovery is possible.

Cysts of Adrenal Gland, with Case Report. D. L. Reimann and W. L. Guyton.—p. 479.
Pathogenesis of Polycystic Pancreas: Reconstruction of Cystic Elements in 1 Case. R. F. Norris and R. M. Tyson.—p. 485.
Ectopic Smooth Muscle in Human Gastric Mucosa. R. Lattes.—p. 501.

Aleukemic Myelosis.—According to Heller and his associates the existence of a disease closely related to, or a variant of, myelogenous leukemia has been known for many years. It presents features sufficiently distinct to have resulted in its separation from leukemia. The authors report 3 cases which, together with a review of the literature, led them to identify a syndrome characterized by splenomegaly and nonspecific alterations in the blood as a form of myelogenous leukemia. Many cases of this type are genuinely aleukemic. Although this disorder is not particularly rare, its leukemic nature has not been generally recognized because of atypical clinical, hematologic and pathologic features. Its identity has been obscured by a diversified terminology. Aleukemic myelosis is an appropriate designation. Osteosclerosis may occur in the course of myelogenous leukemia. Its occurrence favors the development of an aleukemic state of the blood. The criteria alleged to differentiate the disorder from leukemia do not withstand critical analysis. Cases of the type reported present strong evidence to support the belief that much of the myeloid reaction of the spleen, liver and lymph nodes in myelogenous leukemia is not an expression of colonization (metastasis) but of myeloid transmutation of the local reticuloendothelial system of these organs.

Lesions Following the Use of Ertron in Rheumatoid Arthritis.—A woman aged 63 with rheumatoid arthritis took daily for about a year, without medical supervision, three or four capsules of ertron, that is, from 150,000 to 200,000 international units of vitamin D. Numerous abscesses developed. The woman died one month after admission to the hospital. On the basis of clinical and postmortem observations Bevans and Taylor conclude that the use of ertron led to hypercalcemia and calcium deposition in the periarticular and subcutaneous tissues, lungs, heart and kidneys. There were chronic and acute granulomatous lesions in the lungs, the pancreas, the kidneys and the lymph nodes the nature of which was obscure. It is suggested that these lesions are related to the use of ertron. Extensive damage to the renal tubules formed an anatomic basis for clinical renal insufficiency.

Medical and Surgical Treatments in Essential Hypertension.—A review of 1,072 records of patients seen personally by Rogers and Palmer is the basis of the comparison of the effects of medical and surgical treatments of hypertension.

They found that, when therapeutic effectiveness is judged by a persistent lowering of the blood pressure to normal or near normal, dorsolumbar sympathectomy is twice as effective as a general medical regimen plus the use of thiocyanate, but after three years this is maintained in only 25 per cent of the patients, though at least 60 per cent show some lowering of the blood pressure. Relief of headache and throbbing of the head by dorsolumbar sympathectomy is nearly 100 per cent, while general symptomatic relief by medical means varies from 90 per cent in grade 1 to 46 per cent in grade 3 and is as a rule only temporary and in a smaller proportion with malignant grade 4 hypertension. Sympathectomy is regarded as the treatment of choice in malignant hypertension if renal impairment is not severe and there is no frank congestive heart failure. Operation may be offered to patients with benign hypertension whose blood pressures by interval observations appear to be growing worse. In many cases essential hypertension is compatible with a long and active life; often it is not accompanied by symptoms for many years.

Vectors of Rickettsial Diseases. G. M. Kohls.—p. 713.
Kala-Azar in United States: Review of Literature and Report of 2 Cases: Stilbamidine Treatment. H. D. Ecker and J. M. Lubitz.—p. 720.
*Aspirin Allergy: Its Relationship to Chronic Intractable Asthma. S. Friedlaender and S. M. Feinberg.—p. 734.
*Anoxemia Test for Coronary Insufficiency. H. J. Weintraub and L. F. Bishop Jr.—p. 741.

Folic Acid in Sprue.—Suárez and his co-workers administered folic acid to 22 white patients, 17 men and 5 women between the ages of 18 and 67, with full blown sprue. An additional 28 patients with sprue had been maintained in relatively good health for a number of months or years under adequate parenteral liver therapy; they were transferred from that to the oral administration of folic acid. The efficacy of folic acid in the treatment of tropical sprue has been confirmed and extended in these 50 patients. The daily oral administration of 10 mg. proved adequate. The administration of small daily doses is more effective than fifty times as much given in a single dose. Observations made on 5 patients suggest that a daily dose of 20 mg. of folic acid together with an adequate sprue diet rich in animal proteins and vitamins but poor in fats and carbohydrates produces better results than the administration of larger doses accompanied by an inadequate diet low in animal proteins and high in carbohydrates and fats. The maintenance dose of folic acid has not been established definitely, but 2.5 to 5 mg. daily seems to be an adequate maintenance dose for the majority of the patients.

Immobilization of Both Lungs in Pulmonary Tuberculosis.—Barach obtained immobilization of both lungs by immobilization of the chest wall and diaphragm in 12 patients with advanced bilateral and moderately advanced pulmonary tuberculosis who were treated in the equalizing pressure chamber. A normal exchange of oxygen and carbon dioxide is maintained without the movements or the effort of breathing. The mechanism is dependent on the equalization of pressures on the two sides of the chest wall. This is achieved by delaying a wave of alternating pressure to the degree required to compensate for the resistance of the nasopharyngeal tracheobronchial passage way. Six patients recovered clinically, 1 patient showed definite improvement, 3 obtained slight to moderate temporary benefit and 2 showed no change. Five of the 6 patients who recovered were observed for variable follow-up periods of one to seven years. Of the 12 patients, 8 were given a single course of three to four months for eight to eleven hours daily, 3 had two courses and 1 had three courses. That closure of tuberculous cavities is a specific result of immobilization of both lungs has been demonstrated in cases unsuitable for or unresponsive to other methods of treatment by x-ray evidence of cavity disappearance during treatment, its reappearance on bed rest following termination of chamber therapy and a repetition of closure of the same cavity by a subsequent course.

Aspirin Allergy.—Friedlaender and Feinberg observed 45 persons (17 men and 28 women) with severe chronic asthma and a history of hypersensitivity to aspirin. The drug allergy in almost every instance was discovered by the patient some time after the appearance of chronic asthma. Familial allergy of some type was ascertained in 33 patients. A high incidence of emphysema, nasal allergy with polyposis, eosinophilia and frequent absence of positive skin reactions to specific agents were observed. Of 16 patients who gave positive skin reactions, attention to these factors resulted in moderate to considerable improvement in 12, while 4 patients showed no appreciable benefit. In the majority in whom etiologic factors could not be determined, management based on the control of associated infectious elements proved disappointing. Nonspecific methods of treatment were of limited value. Since aspirin in these patients produces acute episodes of asthma yet fails to give positive skin reactions, it is suggested that repeated exposure to other substances of a chemical nature in the diet or environment also incapable of giving positive skin tests may be responsible for the chronic asthma encountered in these patients. Allergy to aspirin may be an indicator that the person has acquired the mechanism to react to simple chemical compounds. Such a mechanism could explain the many cases of allergic disease in which a specific protein allergen cannot be identified.

Anoxemia Test for Coronary Insufficiency.—Weintraub and Bishop did the anoxemia test for coronary insufficiency as standardized by Levy and his co-workers on 20 men between the ages of 35 and 66 with angina of effort and on 200 control persons without angina of effort. Eleven (55 per cent) of the 20 patients with coronary insufficiency gave positive objective, electrocardiographic tests. In addition 7 more (35 per cent) gave positive presumptive tests, giving a total of 18 (90 per cent) positive tests, objective and/or presumptive. Nine (4.5 per cent) of the 200 controls gave positive objective tests. There were no positive presumptive tests in the control group. Of these 9 cases there were only 2 (1.0 per cent of the control group of 200) which had no abnormal cardiovascular, hemic or emotional factors present which might account for a positive test. This 1.0 per cent may be considered either as false positives or as examples of coronary insufficiency of obscure etiology. Within the strict limits as defined by Levy and his co-workers and with the added caution that the test shall be terminated immediately after a four lead electrocardiogram taken directly at the onset of pain, this test may be considered safe and an office procedure requiring the attendance of the physician and one technician. Reactions are readily relieved by the administration of 100 per cent oxygen. This test is a valuable aid in the diagnosis of coronary insufficiency.

Helminthic Infection of the Wall of the Gallbladder. P. H. Hartz, M. J. Hugen-Holtz and A. Van der Sar.—p. 408.

Visceral Kaposi's Disease.—Tedeschi and his associates direct attention to the uncommon condition first described by Kaposi and designated first as "idiopathic multiple pigmented sarcoma," then as "sarcoma idiopathicum multiplex hemorrhagicum" and currently as Kaposi's sarcoma or multiple idiopathic hemorrhagic sarcoma. Tedeschi reviews the literature on Kaposi's disease with particular attention to the visceral manifestations. From the study of 2 cases in which the liver, kidney and small bowel showed multiple independent growths and of a third case with mediastinal localization, all the growths consisting of newly formed blood channels and including proliferations of endothelial and adventitial connective tissue cells, of phagocytic histiocytes, of fibroblasts, of lymphoid elements, of a well organized reticulum and, in 1 case, of immature hematic cells, he concludes that the patterns of the visceral lesions were identical with those of the cutaneous lesions of Kaposi's disease. It is suggested that Kaposi's disease is systemic in nature and likely to involve simultaneously or successively the skin and the internal organs and that it is characterized by a great variety of patterns inherent in the multiple developmental potentialities of the basic unit of growth, the reticulum cell.

Rupture of Heart from Blast Injury.—A 19 year old soldier, member of a blasting and drilling crew, was killed by a premature explosion while working directly over a drill hole in which dynamite had been placed. Death occurred almost instantly. Necropsy revealed a pericardial sac tense and blue-black, with the color of the enclosed blood showing through it. About 700 cc. of liquid and coagulated blood was found within the sac. Three rents were found in the left ventricle. Death was obviously caused by rupture of the left ventricle with the resultant hemopericardium and acute cardiac tamponade. This injury was the direct result of the blast, as proved by the facts that there was no penetrating wound of the chest and that the pericardial sac was intact.

Increasing Importance of Q Fever.—Cheney points out that since 1945 Queensland fever, or Q fever, has passed from a limited orbit of concern to worldwide interest, because it has been identified in three new localities. In each instance the presence of Q fever infection was not believed to be due to a chance importation. Rather it was considered as due to an endemic focus, long present but only just brought to light by the increase in diagnostic facilities. The presence of Rickettsia burneti, which causes Q fever, has been reported from Panama, Italy, the Balkans and Texas, where it has caused "virus pneumonitis" infections. As Q fever is now known to be widely spread throughout the world, and as serologic tests satisfactory for diagnosis have been developed, this infection assumes an increase in clinical and public health importance.

Treatment of Malignant Melanoma.—Pack and his associates present an analysis of 862 cases of malignant melanoma, of which 595 were available for five year end result study, with an overall salvage of 9.7 per cent. Radiation therapy alone has yielded no five year survivals. Surgical attack has resulted in 38.4 per cent three year and 17.7 per cent five year salvage for localized melanomas, and 18.7 per cent three year and 15.6 per cent five year salvage of patients with melanoma metastatic to regional lymph nodes. There is presumptive evidence of a trend toward greater saving of life by widening the scope of the radical surgical attack through the institution of one fundamental principle of cancer surgery, namely the *en masse* excision of the primary lesion with its entire lymphatic drainage basin and the dissection of the regional nodes "in continuity."

Rupture of Heart.—Ellwood shows that, in cases of sudden death, postmortem examination will sometimes disclose a rupture of one of the ventricles through the area of a recent infarction. He reports histories of 4 patients who died suddenly, with necropsy revealing rupture of the anterior surface of the left ventricle. In the first 2 cases there was rupture of the left ventricle due to a recent infarction, yet clinically no symptoms presented themselves. The true diagnosis was established only by necropsy. The third case was interesting in that a diagnosis of coronary insufficiency was made ante mortem, yet the patient was asymptomatic and refused to stay in bed. The myocardium ruptured fifteen days later through an area of a second infarct below an already weakened part of the ventricle. In case 4 also there had been ante mortem coronary insufficiency, and a rupture developed through the site of a new infarction. Examination revealed the scarred muscle of an old infarct. These 4 deaths occurred within a short period. The author concludes that rupture of the heart following a recent myocardial infarction is a far from rare cause of acute cardiac failure. All cases of sudden death should have a postmortem.

The Sippy Regimen Protects Against the Histamine-Provoked Ulcer. J. Fast, S. Friesen and O. H. Wangensteen.—p. 662.

Effect of Radiation Therapy on Nocturnal Gastric Secretion in Patients with Duodenal Ulcer.—Levin and his co-workers report studies which demonstrate that the fasting nocturnal gastric secretion in 28 patients with uncomplicated duodenal ulcer varied from 550 cc. to 1,750 cc., the average value being 1,110 cc., with a free acidity ranging from 18 to 122 clinical units, with an average of 62. In 9 patients studied during the period of x-ray therapy directed at the fundus and body of the stomach, a reduction in the volume secreted and the free acidity of the night secretion was noted during the first week of therapy in 7; an increase occurred in 2. In 14 of 15 patients studied at varying intervals after therapy a decrease in volume occurred, the average reduction being 47.4 per cent. In 1 patient the volume was increased but the free acidity disappeared. In all patients there was a noticeable reduction in the free acidity of the nocturnal secretion, the reduction amounting in 13 of the 15 to complete anacidity. Comparable reduction was observed in the gastric secretory response to histamine.

Polyps of Stomach.—Paul and Logan say that in the course of 1,725 gastroscopies 10 cases of gastric polyps and 3 questionable cases were found. Although the histologic structure of gastric polyps is variable, the majority are adenomas, with leiomyomas forming the second largest group. Certain polyp-like lesions are found on microscopic examination not to be tumors and are referred to as pseudopolyps. The most important aspect of gastric polyps is their tendency to become malignant, although the exact incidence of this degeneration is not known. Reports in the literature indicate a higher incidence of gastric polyps than was found in the series of gastroscopies under consideration. The authors cite factors that may account for this discrepancy. The clinical picture is in no way diagnostic, and frequently the condition is asymptomatic. However, any patient with gastrointestinal bleeding, obstructive signs (especially if intermittent), and, in fact, any gastrointestinal complaints which are unexplained should be thoroughly examined for the possibility of gastric polyps. The only means of establishing a diagnosis is by x-ray and gastroscopic examination. Their combined use should give a high percentage of accurate diagnoses. The statement that all gastric polyps require surgical removal should be modified. Although it is true that all large polyps or those which suggest malignant changes should be removed, the usual small benign polyp does not require such a radical procedure. These are probably just as well left alone, although gastroscopy at frequent intervals is necessary to catch signs of malignant degeneration.

Symptomatology of Chronic Gastritis.—Horner points out that there is no agreement among gastroenterologists as to the role of chronic gastritis in the production of symptoms. Many patients showing mucosal changes which we have come to call chronic gastritis do not have symptoms. The records of 50 patients with each type of gastritis were studied. The study demonstrated that the quality of distress in patients with atrophic gastritis is quite different from that found in those having a hypertrophic form of mucosal change. Those with atrophy have an epigastric fulness or sense of pressure which is not related to meals and is not relieved by food or alkali. The patients who were found to have hypertrophic gastritis complained of definite "pain," which was frequently relieved by food and alkali. This qualitative difference suggests that the gastritis itself is concerned in the production of epigastric distress.

Prolapsing Gastric Mucosa.—Appleby employed partial gastric resection in the treatment of 7 patients, 5 women and 2 men between the ages of 40 and 65, with prolapsing gastric mucosa. Of 594 gastric resections only these 7, i. e. 1.1 per cent, have been performed for this condition. The chief complaint was intermittent cramping pain aggravated by food and relieved by emesis. The average weight loss was 26 pounds (11.8 Kg.) over the average duration of seven years preceding recognition and operation. A jockey-cap type of filling defect supervening on traceable mucosal patterns without other gross pathologic change is considered to be roentgenologically pathognomonic of prolapsing gastric mucosa. Gastric analysis revealed a high retention total acidity, with subsequent readings recording a subnormal curve. In 4 cases occult blood was present in the stool from small cracks or ulcers on the surface of the prolapsed turgid mucosa. Postoperatively all patients are alive and well; there has been no recurrence of symptoms. Prolapsing gastric mucosa is a clinical entity and as such should be recognized and correctly diagnosed more frequently. Diagnosis depends on x-ray examination or visual inspection of the opened abdomen. Best therapeutic results are obtained by partial gastric resection rather than by less radical procedures.

Chondromalacia of Patella.—Kallio examined the knee joints of 450 disabled soldiers and surveyed by questionnaire an additional 1,050 disabled soldiers who had amputations during 1939 and 1940 without known history of trauma of the knee. Of the 1,500 disabled soldiers 1,308 (87 per cent) belonged to the age groups between 21 and 40, which is of interest as chondromalacia of the patella in persons younger than 20 is of little importance and in persons older than 40 has also been established in 65 to 100 per cent of nonamputated persons. In the age groups between 21 and 40 years manifest chondromalacia of the patella was observed to be causing knee pain in 23 per cent of the examined men and in 27 per cent of the questionnaire men with femur amputations. The troubles set in either during the amputation year or in the following year. In both groups incidence of chondromalacia was lower among the men with crus amputations than in those with femur amputations. It is suggested that walking with a prosthesis is apt to cause manifest chondromalacia of the patella. In femur amputations the condition is probably caused by overexertion of the one knee. The apparent lower incidence in crus amputations is probably due to the fact that in these cases the prosthesis is more apt to restore the weight conditions prevailing before amputation. When after using a prosthesis a previously healthy person is affected with chondromalacia of the patella, increasing his invalidity, the disorder should be considered a sequela to the original trauma from the point of view of insurance medicine.

Syndrome Simulating Poliomyelitis.—Young says that during the week of August 11 to 18, 1946, when a total of 34 new cases of poliomyelitis were reported in Nebraska, there was considerable apprehension on the part of the people of that area. Each day the press reported new cases and the precautions to be taken. In letters to editors, readers asked for spraying of the city with DDT and offered new epidemiologic theories. Precautions dictated by fears were at times extreme. During the week when 34 new cases of poliomyelitis appeared in the state, 5 cases closely simulating poliomyelitis were observed in private practice, in 4 of which there was hysterical paralysis of one or more extremities. The author reconstructs the following composite picture: an attitude of great anxiety precipitated by the development of poliomyelitis in the community; an intensification of anxiety by the appearance of poliomyelitis in the family group; concern about exposure; subsequent development of an upper respiratory infection with attendant symptoms as well as the somatic expressions of anxiety in the form of neck stiffness, tightness in the throat and feelings of suffocation and weakness, and finally a localization of the weakness in one or more extremities as a conversion symptom, with a prompt return of function on reassurance and explanation.

Control of Roaches and Bedbugs with DDT.—Stenburg's investigation of various methods of applying DDT for roach control revealed that overall dusting with 10 per cent DDT powder of obvious cracks around baseboards, window frames and door frames, as well as applications in cupboards, trunks, cabinets and drawers, resulted in effective control of American roaches which were living inside the house. Roaches entering the house from the outside were effectively controlled, at least for the duration of this study, by treating the outside breeding places, such as incinerators, garages and garbage disposal places, with 5 per cent DDT spray and 10 per cent DDT dust, supplemented by dusting the ground immediately surrounding the house. DDT toxicity to bedbugs was investigated by treating groups of infested houses with various DDT sprays, using different solvents and in concentrations ranging from 2.5 to 35 per cent DDT. Extent of DDT treatment ranged from spraying only the mattress in the first group of houses to spraying the entire house and furniture in the fifth group. All methods of treatment used resulted in complete control of bedbugs for the duration of the study.

Protein Hydrolysates in Parenteral Nutrition.—Koop and his co-workers studied the nitrogen balance in 22 fresh postoperative and in 4 nonoperative patients for five day periods during which food was provided parenterally by means of continuous intravenous infusions of solutions of glucose and various preparations of hydrolyzed protein. Gelatin was added in some instances to replace half of the hydrolysate, and in 3 instances it was used as the sole source of nitrogen. Positive nitrogen balance was obtainable by parenteral administration of protein hydrolysates, but the results were a little less satisfactory than when the protein hydrolysates were given by mouth. Positive nitrogen balance was not obtained by gelatin as the sole source of protein, but when one half of the protein hydrolysate was replaced by gelatin the results were slightly better than with hydrolysate alone. Nitrogen intakes as high as 0.69 Gm. of nitrogen per kilogram daily were successfully given for five day periods. When the nitrogen intake was 0.40 and 0.47 Gm. of nitrogen per kilogram daily, positive nitrogen balance was observed in 2 patients who were in negative caloric balance (10 and 12 calories per kilogram daily respectively). Venous thrombosis appeared to be the chief limiting factor in parenteral nutrition.

Aspiration Biopsy of Lymph Nodes.—Meatheringham and Ackerman studied 300 consecutive biopsies of lymph nodes performed on 245 patients who presented lymphadenopathy considered to suggest the existence of a neoplasm. One hundred and ninety-seven of the 300 aspirations were considered successful in that either tumor or lymphoid tissue was secured. One hundred and three cases represented technical failure to obtain sufficient tissue, but subsequent clinical course or further diagnostic procedures proved only 34 of these to be in error (11.1 per cent of total aspirations). Aspiration biopsy provides a reliable, safe, rapid and economical method of investigating lymph node enlargements. Its greatest value lies in the evaluation of nodes suspected of being the site of metastatic disease, particularly those regional nodes approximating foul and infected primary lesions. The decision as to operability or inoperability or the choice of treatment is facilitated by the establishment of the presence or almost certain absence of metastases in enlarged nodes. Aspiration biopsy also provides an accurate method of determining the presence of metastasis in patients to be treated by x-rays, and the size of the field may be chosen accordingly. It is emphasized that the diagnoses which were made in these aspiration biopsies were based entirely on paraffin sections and not on smears.

Surgical Treatment of Herniation of Subfascial Fat Causing Low Back Pain.—Herz presents anatomic and clinical evidence that cases of severe low back pain in which painful nodules can be palpated are due to herniation of subfascial fat through the deep layer of the superficial fascia. Temporary relief was obtained by injection of the painful areas with anesthetic solution in 109 cases of this type. In 37 cases the herniated fat was removed surgically, and in 34 there has been complete relief of all symptoms. This clinical entity is not uncommon. The presence of a painful nodule, with disappearance of pain after injection with anesthetic solution, is diagnostic.

Herniation of Subfascial Fat and Low Back Pain.—Hench points out that to Herz belongs the credit of presenting the first confirmation of the important work of Copeman and Ackerman on the fat herniations. He suggests that the treatment of such tender fat nodules need not necessarily be surgical. Copeman and Ackerman removed the nodules surgically for purposes of clinical demonstration. Herz operated in only 37 of his 109 cases. Copeman and Ackerman believe that surgery is not indicated in most cases and that the use of heat, massage and motion in such cases is rational. Physicians will probably treat such cases conservatively, but surgeons will probably treat them surgically. In selected or stubborn cases prompt surgical treatment of the nodules may save time and money. Hench calls attention to the parallelism existing between the development of our knowledge about herniated fat and herniated intervertebral disks as a cause of low back pain.

Fatal Poisoning by "Lethane" Insecticide. C. V. Harrison.—p. 722.

Chilling of Abdomen and Acute Nonspecific Diarrhea and Dysentery.—Kershaw says that acute enteritis of unknown origin is common in Europeans visiting hot climates and is extremely frequent in ships. Reviewing observations made on ships during the war, the author says that typically the patient was awakened with generalized abdominal colic and an urgent call to defecate. In mild cases a few loose stools and waning bouts of colic saw the end of the attack by the following midday, but in severe cases the colic persisted and the stools became watery, progressing even to mucous and blood stained, and the course lasted several days with prostration and anorexia and a slightly raised temperature. The frequency of small and large outbreaks was in contrast to the exceptional rarity with which known pathogens were detected. Local chilling of the abdomen is a known cause of diarrhea. Circumstances causing local chilling are common in hot climates and extreme in overcrowded ships in which the plenum system of ventilation is used. Clinical observations are cited which indicate that chilling of the abdomen or anterior abdominal wall is a common cause of acute nonspecific enteritis. On entering a hot climate the change from thick to thin clothes should be made gradually. Cool drinks should be sipped slowly, and sitting in the direct draft of forced ventilation for long periods should be avoided. At night the abdomen should be protected by a cholera belt or a blanket.

Epidemic Diarrhea and Vomiting.—Hargreaves describes two outbreaks of diarrhea and vomiting occurring at two county institutions in Cornwall during 1946. These outbreaks were part of an epidemic among the surrounding population. With the exception of three deaths, all of aged patients, symptoms were mild and conformed to previous epidemics reported in the literature. Evidence obtained from these Cornish outbreaks points to an airborne disease with an incubation period of seventy-two hours, the port of entry being either the upper respiratory or the gastrointestinal tract; the organism is probably a virus. There is strong evidence that epidemic diarrhea and vomiting of newborn babies is not caused by the same organism as that in adults.

Estimation of Vitamin C in Leukocytes by Hydrazine Method. P. Constantinides.—p. 750.

Progesterone in Treatment of Migraine.—According to the Singhs the etiology of migraine is varied. Among 30 women with migraine who had responded poorly to the usual therapeutic methods they found 23 with clinical evidence of estrogen hyperactivity. In all of these it was shown that estrogen would precipitate an attack. In all 23 cases progesterone was effective in relieving or preventing attacks of migraine. Various associated symptoms also disappeared with its use. The name "estrogenic migraine" might be appropriate for this condition.

Penicillin in Postoperative Progressive Bacterial Synergistic Gangrene.—A printer aged 49 was hospitalized with a perforated duodenal ulcer. Laparotomy was performed, and a small perforation on the anterior surface of the first part of the duodenum was sutured. On the seventeenth day two patches of gangrene appeared on each side of the incision. The gangrene slowly spread. A course of 1,000,000 units of sodium penicillin (20,000 units intramuscularly every three hours) was started on the eighteenth evening. Locally, penicillin cream and dry dressings were applied alternately. After three days the condition had stopped spreading, and healing followed rapidly. Clarke says that gangrene may develop in the abdominal skin after drainage of foul intraperitoneal abscesses, gangrenous appendicitis, perforated duodenal ulcers or other conditions in which the incision has been contaminated with intestinal organisms. It may also develop after the drainage of lung abscesses or fetid empyema in the skin of the chest wall. Most of the reported cases have arisen in the region of tight sutures, which are undoubtedly a predisposing cause. Many cases have been diagnosed late, and these have often proved fatal. With early effective radical operation recovery usually occurs, often with considerable loss of skin and scarring. It is hoped that with penicillin the mortality and scarring may be reduced.

Pyelo-Adreno-Neural Syndrome.—Schepers presents evidence for a pyelo-adreno-neural syndrome based on a study of 50 cases culled from an accumulation of Reef Benefit Society chronically sick patients. The author computed that the incidence of this syndrome is at least 0.2 per cent in a potential reservoir of 50,000 subjects. He describes 2 representative case histories which illustrate two major varieties of the pyelo-adreno-neural syndrome. Case A emphasizes the role of the adrenal cortex in the genesis of the symptoms. Case B directs attention to the adrenal medulla, the case also being an example of a relatively chronic disorder. Case histories tend to fall under one of at least four clinical groups, depending on whether the functions of the cortex or the medulla of the adrenal are stimulated or suppressed. In addition, a large proportion of cases must be regarded as panadrenal syndromes, in which there may be combinations of cortical and medullary overaction or underaction, or cortical overaction plus medullary failure, or both. While the patient is being studied, the clinical emphasis may shift from the cortex to the medulla (or the reverse), and hyperfunction may succeed or precede hypofunction. Tables are presented which analyze (1) the general clinical features, (2) symptoms referable to the alimentary, cardiovascular and hemopoietic systems and (3) features referable to the urogenital and nervous systems. The author analyzes the biochemical features of selected cases and illustrates in a diagram anatomic and physiologic mechanisms involved in the pyelo-adreno-neural syndrome. It is a condition distinct from well known endocrine syndromes but also partly related to them. The primary role of the upper urinary tract is stressed in pathogenesis. The disease may involve the adrenal gland and celiac plexus by virtue of inflammatory, degenerative, neuroreflexive, vascular and obstructive mechanisms. The pyelo-adreno-neural syndrome probably reflects the existence of a pyelo-adreno-neural mechanism which owes its significance and peculiar vulnerability to the intricacy of its phylogenesis.

Presse Médicale, Paris

55:313-324 (May 10) 1947

*Treatment of Gastroduodenal Ulcers with Intravenous Injection of Milk Proteins. G. Faroy, J. Arnous and J. Fénéon.—p. 313.
Anaphylactic Shock and Serum Cholesterinase. E. Aron and A. D. Herschberg.—p. 314.

Intravenous Injection of Milk Proteins for Gastroduodenal Ulcers.—Faroy and his associates use a preparation consisting of defatted milk 0.50, dextrose solution 2.25 and sodium thiosulfate 2.25. In the presence of an active ulcer the patient is given a total of from fifteen to eighteen intravenous injections at the rate of three injections per week in increasing doses. At the first injection the authors usually give 1 cc. of the preparation, which contains 0.1 cc. of milk. After that the doses are 2, 3, 5, 8 and 10 cc. The 10 cc. dose is rarely exceeded. Contraindications to this form of treatment are the same as those to other forms of shock treatment, that is, active pulmonary tuberculosis, nephritis and decompensated heart disease. When the series of injections has been completed, a roentgenologic control is made of the ulcer niche and, if necessary, the injections are continued. The treatment has given favorable results comparable to those obtained with a formerly available preparation which contained a solution of peptone of casein. Permanent cure of the tendency to ulceration is of course as impossible with this as with other methods, but it rapidly controls the acute attack and prevents recurrences if it is given periodically once or twice a year in the form of a series of twelve injections given at the rate of two a week.

Annales Paediatrici, Basel

168:113-168 (March) 1947

Syndrome of Mauriac (Retardation of Height Growth and Disturbances of Fat Distribution in Diabetic Child) and Its Relation to the Glycogenic Disease of Van Creveld von Gierke. R. Houet.—p. 113.
*Case of Toxoplasmosis with Recovery. P. Robinson.—p. 135.
Juvenile Form of Hereditary Diffuse Cerebral Sclerosis (Type Scholz). Cornelia De Lange.—p. 138.
*Case of D Vitamin Intoxication. M. Skatvedt.—p. 149.

Recovery in Case of Toxoplasmosis.—Robinson observed a girl, aged 9, who after two weeks of high fever developed neurologic symptoms. There were strabismus, nystagmus, chorioretinitis, absent abdominal reflexes, positive Kernig's sign, absent knee and ankle jerks and positive Babinski sign. Lumbar puncture revealed normal fluid which contained Toxoplasma parasites. The fluid of the second and third lumbar punctures coagulated immediately and also contained encysted and free Toxoplasma parasites. Treatment with sulfathiazole 0.75 Gm. four hourly and emetine 0.015 Gm. daily continued for twelve days, resulted in clinical recovery. However, nine days after treatment was discontinued the temperature rose again and some of the neurologic symptoms reappeared. Treatment was resumed and continued for six more days, after which the child made a complete recovery.

Vitamin D Intoxication.—A girl aged 1 year who by mistake had been given for six months a concentrated vitamin preparation containing 250,000 units per cubic centimeter instead of the supposed 15,000 units had received 6,500,000 international units, the equivalent of thirteen massive doses. Her health became impaired, she had attacks of vomiting and she lost weight. The calcium content of the blood was about twice the normal value. The nonprotein nitrogen of the blood was increased and isosthenuria existed. X-rays showed a hypercalcified zone in the metaphysis. Electrocardiography revealed changes in the T waves. After two and a half months most pathologic changes had disappeared. The only treatment the child was given was that the urine was kept acid by the administration of ammonium chloride until the blood calcium was normal, because the phosphates of calcium precipitate more readily in alkaline urine, and it is in the period when the blood calcium decreases that the risk of metastatic calcifications is greatest. To avoid overdosing with vitamin D, the author suggests that the concentrated preparations should not be used in ordinary practice and they should be dispensed in specially marked bottles.

Schweizerische medizinische Wochenschrift, Basel

Internal Treatment of Gastric and Duodenal Ulcers.—Surkes points out that American physiologists have tried a number of hormone-like substances from the gastrointestinal mucosa in the treatment of gastric and duodenal ulcers and says that similar experiments have been carried out in Switzerland since 1937. He reviews observations on 92 patients who were given this type of substitution therapy. In the presence of active ulcer symptoms the preparation is administered both by intragluteal injection and by mouth. The number of injections varies between twelve and twenty-one. Oral medication by means of tablets is continued for from three to four weeks after completion of the series of injections. As regards diet the patients were told to refrain from eating the coarser types of the vegetables of the cabbage family and beef as well as foods that they knew from experience would not agree with them. Favorable results were obtained in 82 per cent of the patients with gastric and in 92 per cent of the patients with duodenal ulcer. Questionnaires from one to four years after treatment revealed some recurrences, but the author thinks that occasional prophylactic administration of the tablets might help to prevent recurrences.

*Tropical Eosinophilia. W. Telles.—p. 759.

Blood Changes in Rat with Benzpyrene Sarcoma.—Salvatore studied the blood picture of normal adult rats and of rats in which tumors had been induced by the subcutaneous injection of an oily solution of benzpyrene. He observed that neutrophil leukocytosis, monocytosis and oligocythemic anemia developed in the rats with sarcomas. There was a direct relationship between the severity of the blood changes and the size of the sarcomas. The author thinks that the blood changes depend at least partly on the intraneoplastic hemorrhages.

Tropical Eosinophilia.—Telles observed in a child aged 19 months the clinical, roentgenologic and hematologic aspects of the condition described by Weingarten as tropical eosinophilia. There were cough with nocturnal paroxysms, mild fever, anorexia, failure to gain weight and cervical, axillary and inguinal micropolyadenia. The x-ray examination revealed an extensive mottling of micronodular shadows over both lung fields, with increased hilar images. Examination of the blood showed a leukocytosis of 2,800 to 38,500, of which 35 to 53 per cent were eosinophils. Eggs of Necator and Trichiuris were found in the feces, but it is noteworthy that all symptoms and findings remained after treatment of the verminosis. Intramuscular injection of an arsenical resulted in improvement of clinical symptoms, with a tendency to normalization of the white blood cell count. Reviewing the literature on this condition, the author points out that the differentiation between tropical eosinophilia and Löffler's syndrome is not clear.

*Endemic Malaria and Prevention with DDT in Spanish Morocco. A. Irigoyen Ramírez and S. Medina Wahnon.—p. 302.

Malaria.—Spanish Morocco is a zone of endemic malaria. Prevention has been difficult up to now because of (1) the anthropophilic type of mosquitoes, (2) the ignorance of the Mussulmans and (3) immigration of people from nonmalarial zones. Plasmodium strains increase in virulence through passage in the blood of immigrants without previous warning and cause endemic malaria even among those who have been warned. This is the case whether the newcomers change from normal to malarial zones or the reverse. The authors report satisfactory results from the use of DDT on eggs, larvae, nymphs and adult mosquitoes. The antimosquito effects of DDT are prolonged, the drug is nontoxic for Gambusia fish and for cattle, and it is economical and easy to use.

Penicillin in Meningitis. C. A. Videla.—p. 1.
Penicillin in Osteomyelitis. F. O. Alarcón.—p. 5.
*Clinical Course and Treatment of Bubonic Plague. C. A. Videla.—p. 15.

Bubonic Plague.—During the first two weeks of December 1946, 5 persons in a suburban district of Buenos Aires were hospitalized with a diagnosis of bubonic plague. Four of the 5 patients had septicemia and were in a grave condition. Two adolescent patients were actually ill with septicemia and 1 with plague meningitis. Administration of antiplague serum for the first three days in the course of the disease was ineffective. The patients were given intramuscular injections of streptomycin. The patient with meningitis received in addition two intracisternal injections of streptomycin in doses of 125 mg. and 100 mg. each, with an interval of eight hours between the injections. All the patients recovered.

Active Immunization Against Diphtheria. E. Gorter.—p. 101.
*Influence of Folic Acid on Symptoms of Celiac Disease. W. H. H. Tegelaers and H. A. Weyers.—p. 107.

Exchange Transfusion in Treatment of Erythroblastosis Fetalis.—Soeters discusses indications for exchange or replacement transfusions in newborn infants with erythroblastosis fetalis and presents observations on 2 newborn infants in whom a modification of Diamond's technic was used for the replacement transfusion. A formula is given to estimate the concentration of donor blood at the end of the exchange. Roentgenograms show the position of the catheter and reveal the passage through the umbilical vein and the ductus venosus.

Role of Pediatrician and Family Physician in Solving Relationship Between Rubella and Congenital Defects.—Since it is almost certain that rubella (German measles) when contracted by the mother during the first months of pregnancy may be the cause of congenital anomalies in the child, Kamerbeek and van Gilse suggest that physicians should be asked to report positive and negative observations on this problem. They should also obtain throat and nose washings and blood in order that a virus may be sought in cases with manifest rubella exanthem as well as in contact cases. They should collect convalescent serum.

Folic Acid in Celiac Disease.—Tegelaers and Weyers treated 7 children with celiac disease by giving them daily for thirty days 10 mg. of folic acid by mouth. Fat resorption improved in all the children. Most of them showed an increase in weight, and in all except 1 the general condition improved. However, there was no noticeable reaction in the hemopoietic system.

Infectious Mononucleosis.—Heyeraas says that, through systematic examinations of the blood with differential count carried out from 1943 to September 1946 in the epidemic division of Trondheim Hospital in all cases of angina, 23 cases of infectious mononucleosis were diagnosed, of which 15 were between the ages of 15 to 20. No epidemiologic connection was demonstrable. Clinically the 13 cases of membranous angina were hardly to be distinguished from diphtheria. In 6 cases there was generalized enlargement of the lymph nodes, in 17 only enlargement of the cervical lymph nodes. On the continent of Europe the pseudomembranous is the most frequent type of infectious mononucleosis; in England and America the glandular type is most often described. Pathologic lymphatic monocytelike cells are pathognomonic for the disease and dominate the blood picture during the first days. The Paul-Bunnel test, done in 18 cases, was positive in 12. It is a valuable aid in differential diagnosis with regard to acute leukemia. In 1 instance herpes genitalis with exanthem was seen.

Book Notices

Obstetrical Practice. By Alfred C. Beck, M.D., Professor of Obstetrics and Gynecology, Long Island College of Medicine, Brooklyn, N. Y. Fourth edition. Cloth. Price, $7. Pp. 966, with 1,068 illustrations. Williams & Wilkins Co., Mt. Royal and Guilford Aves., Baltimore 2, 1947.

Dr. Beck sets out to present this edition in a concise form for undergraduate students and young practitioners. He has reduced references intentionally and avoided controversy as much as possible. The text and references cover 921 pages. The book is divided into forty-seven chapters. The book is covered thoroughly by a forty-three page index. The book is illustrated rather profusely with a series of drawings which are easily followed. The first three chapters, dealing with the ovarian cycle, menstruation and ovulation, present the author's views adequately. The detail of information is illustrated by the diagram on page 67 showing five variations of placental barriers of different animals. In chapter 12 the mechanism of labor is carried through consistently. However, the implied vascularity of the cervix according to figures 159 to 161 might be objected to. The management of the shoulders on page 309 would give the impression to the inexperienced that much force could be used with safety, though this was not the intention of the author. An error of the printing is corrected by a loose page, as page 388 is in the reverse of 385. An error in the index is found in the reference to syphilis, in which there was a difference of one page. This is not serious and may be accounted for easily. The emphasis on alkalization of the urine for pyelitis seems out of date in view of the procedures used by most obstetricians at the present time. Beck states that "syphilis is one of the commonest causes of fetal death in the latter half of pregnancy." Reports from other institutions are in discord. The emphasis on the value of the cord blood Wassermann test for diagnosis of syphilis of the newborn is subject to criticism.

Special commendation is offered on the chapters on faulty passages and soft part dystocias. This chapter is particularly well illustrated. The discussion of the bony pelvis is presented in an analytical fashion. In a book in which brevity was desired it would seem that the author has at times allowed interest in pathologic changes to be overstressed. In the chapter on puerperal infection insufficient space has been set aside for the discussion of the use of blood, sulfonamides and antibiotics. A conflict is expressed on the use of the bougie in which he adds "It therefore should be the method of choice by those who lack obstetrical skill and as often employed by experienced operators in those cases in which a more rapid and more certain method is not indicated. . . . On the other hand, a maternal mortality of slightly over 1 per cent does not justify its indiscriminate use." In the section on lacerations the colored zones of laceration are quite impressive.

Beck's students and all of his disciples will find this book valuable and helpful. Many portions of it can be studied profitably by undergraduate as well as graduate students.

Genetics, Medicine, and Man. By H. J. Muller, Professor of Zoology, Indiana University, Bloomington, Indiana, C. C. Little, Director, Roscoe B. Jackson Memorial Laboratory, Bar Harbor, Maine, and Laurence H. Snyder, Chairman, Department of Zoology and Entomology, Ohio State University, Columbus, Ohio. Fabrikoid. Price, $2.25. Pp. 158, with 29 illustrations. Cornell University Press, 124 Roberts Place, Ithaca, N. Y.; Oxford University Press, Amen House, Warwick Sq., London, E. C. 4, 1947.

This book contains the text of the six Messenger lectures delivered at Cornell University in the autumn of 1945. Dr. Muller, Nobel laureate in medicine, presents in masterful fashion the elementary principles of modern genetics. With the use of clear and simple diagrams he follows through the several steps of mitosis and meiosis. He considers such problems as the role of genes and environment in differentiation, gene duplication and gene mutation, both natural and induced. On this background he discusses the meaning of sexuality as a mechanism for the recombination of genetic differences in diverse stocks, leading to new adaptive combinations and progressive steps in evolution.

The chapters by Dr. Little on parental influence and growth and individuality contain much interesting and significant material on mammalian inheritance, and the possible application of these findings to medical research, particularly as applied to cancer. However, a rather artificial division of advances in mammalian genetics under three major groupings of so-called morphogenetic, emotional-endocrine and physicosocial factors and environments and the strange use of the term "environmental level" for the categories of characters genetically determined will certainly prove confusing if not misleading to the general reader, for whom the book is largely intended. Dr. Little emphasizes the importance of increased and diversified programs of research on mammalian genetics as a means to a better understanding of the human organism in health and disease.

In the chapters on human heredity and on the mutant gene in man Dr. Snyder presents an excellent summary of modern knowledge of human genetics. He reviews the methods of collecting data on human heredity, considers the relative roles of heredity and environment and discusses the practical application of genetic knowledge to prognosis, diagnosis and prevention of disease. He also considers the medicolegal applications of genetics. Many readers will find his summary of human blood groups, of which there are now some 2,500 distinct combinations of factors known, of particular interest. He outlines the spatial relations of genes, i. e. their positions in the chromosome complex. His discussion of the physiologic relations dealing with the variability of expression and effects on viability will be of particular interest to those who may have thought of hereditary factors either as not subject to treatment or as relatively unimportant in their effects. Under ontogenetic relations he considers such subjects as dominance, gene interaction and multiple factors. He concludes with a simple presentation of gene and genotype frequencies in human populations, the phylogenetic relations of the mutant gene in man. This section of the book will be of great value to all those interested in human biology and medicine.

Progress in Gynecology. Edited by Joe V. Meigs, M.D., Clinical Professor of Gynecology, Harvard Medical School, Boston, and Somers H. Sturgis, M.D., Chief, The Vincent Memorial Hospital Laboratory, Boston. *Cloth.* Price, $7.50. Pp. 552, with illustrations. Grune & Stratton, 443 Fourth Ave., New York 16, 1946.

One of the justifications for this volume is ". . . at this particular time for the purpose of refreshing and bringing up to date those medical men who have spent the last years in the armed forces of their country and who have been far removed from the practice of the diseases of women." To this end the editors laid special emphasis on the endocrine system, neoplasms and operative technics. The book is divided into sections, each on a symposial basis. The authors of each chapter are for most part well known and acknowledged authorities. Meigs and Sturgis deserve credit for the organization and placement of the respective papers.

Many of the chapters are unusually well done for a book of this purpose. Special credit is due such authors as M. Edward Davis on gonadotropins, U. J. Salmon on androgen therapy, Richard W. TeLinde on "intraepithelial carcinomas," Louis K. Diamond on the Rh factor and Champ Lyons on chemotherapy. TeLinde demonstrates his views by clear illustrations and direct presentation of his thesis. Diamond does as well on the Rh and its relations to transfusion.

Helene Deutsch presents some aspects of the psychiatric component in gynecology but avoids sex and marital problems. This void is the more conspicuous since Dr. Deutsch is particularly able to present this difficult subject. Repetition and confliction of ideas and treatment are more frequent than the hurried reader would desire. For the same reason many practitioners will find moral support for their procedures.

The chapter on dysmenorrhea and the one on leukoplakia, pruritus and senile changes must have been done under pressure. Certainly Keefer might have written more than three and one-half pages on penicillin on infection of the female pelvis.

It would appear that the volume would be of more value to physicians away from metropolitan areas and medical centers. The names alone of some of the authors will ensure sales of the volume. The book is interesting as a whole.

The publishers deserve praise for using a good quality paper, making good reproductions of illustrations, employing a clear, easy to read type and compilation into a well bound volume. Evidence that such a volume has a place is documented by the fact that sixty-nine other authors, most of them with national and international reputations, joined Meigs and Sturgis in this scientific literary effort.

Tratado de patología digestiva. Volumen II: Patología intestinal. Por Carlos Bonorino Udaondo y Mariano R. Castex. Fabrikoid. Pp. 1,297, with 625 illustrations. Lopez & Etchegoyen, S. R. L., Junin 863, Buenos Aires, 1946.

This huge volume was written by a number of authors, all leaders of medicine in the Argentine. Naturally, it contains a tremendous amount of information about diseases of the intestine. It is for the most part well written and it is well illustrated. Most of the chapters have many references to the literature. Unfortunately for a book of this size and coverage, it lacks an index.

Many of the articles, like the one of Calixto Nuñez on tuberculosis, are excellent, while others appear to have been quickly and carelessly written by an assistant in a library. If a new edition should ever be called for it is to be hoped that the editor will get more of the authors to write from their own clinical experience. This would make the book much more attractive and useful. It would help also if the editors were to cut out chapters on questionable diseases such as "the mobile duodenum" or "the dilated duodenum" or "duodenal diverticula" and to assign the space to a better discussion of common troubles such as constipation, flatulence, diarrhea and the sore colon.

A remarkable chapter is the one on foreign bodies that have been found in the rectum. They include such objects as beer bottles and tea cups!

The editors are to be congratulated on the production of such an encyclopedic volume, much like the great handbüche of prewar Germany. As already noted, the only regrettable feature is that as one reads here and there one does not find that the many writers put in enough of their own clinical experience and wisdom.

Penicillin in Syphilis. By Joseph Earle Moore, M.D., Associate Professor of Medicine and Adjunct Professor of Public Health Administration, the Johns Hopkins University, Baltimore. Fabrikoid. Price, $5. Pp. 319, with 57 illustrations. Charles C Thomas, 301-327 E. Lawrence Ave., Springfield, Ill., 1946.

With characteristic thoroughness Moore presents the essential points of penicillin therapy in easily understandable form. Those interested in the clinical use of penicillin will find the section on penicillin in early syphilis very valuable. The same applies to the chapters on syphilis in pregnancy, congenital syphilis, benign late syphilis, cardiovascular syphilis and ocular syphilis. Following a detailed discussion of treatment in these forms of syphilis the author gives a short, pertinent summary of results. Nearly half of the text is devoted to fundamental information on the chemistry, pharmacology, therapeutic activity and mode of action of penicillin. The section on the pharmacology of penicillin in the central nervous system contains timely advice, and the chapter on toxicity is of special interest to the practitioner. Those who plan to read this book will be disappointed if expecting to find solutions for all of the problems of penicillin therapy in syphilis. Neither the lapse of time nor the number of patients treated since the discovery of penicillin has been sufficient to provide answers for all the questions that arise. This is forcefully brought out in the text, and the detailed reasons are presented in all stages and in most of the complications of syphilis.

Maladies et syndromes rares ou peu connus: Description clinique—répertoire des signes et liste des noms propres. Par A. Aimes, professeur à la Faculté de médecine de Montpellier, Montpellier. Préface du Professeur E. Jeanbrau. Paper. Price, 300 francs. Pp. 207, with 26 illustrations. Masson & Cie, 120 Boulevard Saint-Germain, Paris 6ᵉ, 1946.

This brief volume on rare or little known diseases and syndromes contains the collection of diseases and syndromes which appear in literature under eponyms, some of them little known. A brief description of the clinical aspects accompanies each name. In view of the fact that modern medical dictionaries contain the same information, the value of the volume, particularly to the American physician, is questionable.

The Ranks of Death: A Medical History of the Conquest of America. By the late Colonel P. M. Ashburn. Edited by Frank D. Ashburn. Cloth. Price, $5. Pp. 298. Coward-McCann, Inc., 2 W. 45th St., New York 19, 1947.

When Colonel Ashburn died in 1940 the manuscript of this book was found in his effects. His son, Frank D. Ashburn, who had often discussed the book with his father, took over the task of editing and preparing the manuscript for publication. The result is a somewhat disorganized but very readable little volume that should be of interest both to physicians and to the lay public as well. By means of a foreword, and introductory material at the beginning of many of the chapters, the editor manages to give a unity and progression to the story which should make it acceptable to the reading public. By including technical material, historical quotations and references in the appendix, the editor makes the book a really valuable addition to the physician's library. The general thesis developed is that "nearly every part of America was healthful and many parts teeming with population when the whites first came"; that the invasion of the continent by the European nations brought in diseases such as smallpox, measles and tuberculosis to which the Indians were not immune and to which they fell easy prey; that the importation of Negro slaves with their malaria, typhus and dysentery was an even greater blow to the native Indians; that the Indian was defeated not only because he lacked firearms, horses and iron but also because he lacked immunity against most of the diseases which both the whites and the blacks brought with them. It is an interesting thesis, well developed if not profusely documented. While the physician will find much that is old to him, there is a fresh point of view which is well worth an evening getting.

A Book for Us Diabetics and Our Doctors. By Don H. Duffie, M.D. Fifth edition. Cloth. Price, $2.25. Pp. 100, with illustrations. The Author, Central Lake, Michigan, 1946.

In this little book a country doctor with thorough understanding of diabetes and its treatment explains for the benefit of his patients and their physicians how diabetes can be expertly treated by simple means available to every one. There is nothing bewildering about the management of diabetes and no good reason for the attitude of some physicians that if diabetic patients cannot be under the direct care of specialists they might better continue to be left to die. The great advantage in attending a good diabetic clinic is that the patient there meets others who despite the same infirmity and with no better education have learned to overcome the handicap of diabetes. For those who cannot go to such a clinic and for their home physicians this volume will prove immensely useful.

Behandlung von Augenkrankheiten: Orientierung für den praktischen Arzt. Von P.-D. Dr. A. Bangerter, Chefarzt der Augenklinik St. Gallen, St. Gallen, Switzerland. Paper. Price, 4 Swiss francs. Pp. 103. [Sole *distributors for the U. S. A. and Canada*: Grune & Stratton, Inc., 381 Fourth Ave., New York.] Hans Huber, Marktgasse 9, Bern, 1946.

This book on the treatment of diseases of the eye is written for the general practitioner. It is brief and without illustrations. There is a six page list of drugs, many proprietary, for use in the treatment of eye diseases. The first twenty-five pages are devoted to injuries of the eye and lids. The next twenty-three pages deal with inflammations of the lids and tear sac. There are ten pages on conjunctivitis, ten on the cornea, nine on iris and lens, five on the fundus and four on squint. The book is of little value even to the general practitioner and will find no market in the United States, where many more complete and illustrated volumes in English are available.

For Doctors Only. By "Hugh Selwyn." Paper. Price, 5s. Pp. 64. W. E. Harrison & Sons, Ltd., The Ancient House, Ipswich, [n. d.].

British physicians are much more likely to indulge in slightly facetious essays relating to the practice of medicine than are physicians of most other countries. The name Hugh Selwyn is apparently a pseudonym, since the name of the author is placed in quotes. Most of the essays in this little pamphlet were published in the *London Hospital Gazette*. The essays in this instance are presumably conversations between an old time general practitioner and a young man about to undertake a similar form of practice. The essays strike a responsive note in their reminiscences for any one who has dealt with what is called "the mine run" of patients.

Queries and Minor Notes

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards will not be noticed. Every letter must contain the writer's name and address, but these will be omitted on request.

AMEBIASIS

To the Editor:—1. What is the annual number of deaths in the United States from amebiasis and the number who have severe complications such as liver abscess, brain abscess and amebic hepatitis? In other words, what are the chances on a percentage basis for the average patient to die from the disease or suffer one of its serious complications? On the basis of the answers to these questions, how vigorously is one justified in treating the average patient? 2. Is it considered likely that a patient may have amebic hepatitis or liver abscess with neither fever, leukocytosis nor elevation of the sedimentation rate? Would such a case be considered commonplace or a rarity? 3. How reliable is the complement fixation test in making or excluding the diagnosis of amebiasis in a case in which the organisms cannot be demonstrated in the stools? 4. What textbook is recommended for a thorough description, with illustrations of the characteristic lesions of amebiasis as seen through the sigmoidoscope? 5. In the disease considered to be a common cause for such vague complaints as slight griping or tenderness in various parts of the abdomen, slight tenderness in the region of the liver or malaise and lassitude not associated with anemia, fever or other discernible causes?

Weldon J. Walker, Lieutenant Colonel, M. C., U. S. Army.

Answer.—1. Reports of the incidence of infection with Endameba histolytica range from as low as 0.05 per cent in a Philadelphia hospital to 55.5 per cent in a New Orleans orphanage. According to Faust the incidence in most parts of the United States varies from between 5 and 10 per cent, being high in some areas such as the rural Southern Appalachians and as low as 1 per cent in some Northern areas. An incidence of 20 to 25 per cent has been reported among servicemen returning from the Orient. Faust states that "amebic invasion of the liver is probably much more common than the records of acute hepatic amebiasis indicate." Craig states that liver abscess occurs in approximately 15 to 20 per cent of persons who have suffered from attacks of amebic dysentery. Faust also reports that 10 per cent of patients with appendicitis in the surgical service of Dr. Alton Ochsner in the Charity Hospital, New Orleans, were found to have amebic involvement. Infection with cysts of E. histolytica does not necessarily imply disease from a clinical standpoint. Many patients with infection do not present symptoms. Such persons are carriers or cyst passers. The pathologic change may be minimal. The carrier state may be more important from an epidemiologic point of view than from the clinical standpoint. Reports of "amebic dysentery" are published by the U. S. Department of Commerce (Bureau of Census vital statistics and special reports). In 1945 there were 3,410 cases reported and 190 deaths. Because methods of reporting dysenteries vary among the states, and because many cases undoubtedly are never reported, these figures have limited value. The number of fatalities from complications is not available.

All patients with acute amebic dysentery should be treated with bed rest and appropriate diet (liquid initially and bland later). Use of laxatives and cathartics is inadvisable. Mild and moderately severe cases will respond to such iodine preparations as chiniofon, vioform or diodoquin. Chiniofon (enteric coated) is given orally in a dose of 0.75 to 1 Gm. three times a day for seven days. It may be given as a retention enema (200 cc. of 2 per cent warm water solution daily). Vioform capsules may be given orally, the dosage being 0.25 Gm. three times a day for seven to ten days. Carbarsone is a well established drug given by mouth in doses of 0.25 Gm. twice a day for seven to ten days. Carbarsone and similar drugs containing arsenic are contraindicated in the presence of liver disease and occasionally cause a toxic reaction. In cases with complications such as hepatitis and hepatic abscess emetine hydrochloride 30 mg. subcutaneously twice a day or 60 mg. subcutaneously once a day is effective. It is wise to give it for no longer than one week and certainly it should not be given longer than ten days. An emetine course should not be repeated until at least six weeks have elapsed. Its use should be discontinued at once with the appearance of toxic symptoms, including nausea, vomiting, muscular weakness, neuritis and myocarditis. Electrocardiographic studies before and at intervals during therapy are desirable for early detection of myocardial damage. In an acute infection with severe diarrhea an emetine compound may be useful to control the diarrhea. Chemotherapy and antibiotics are indicated only for the control of secondary infection.

2. Walters and his associates reported in 1944 two cases of amebic hepatic abscess not suspected until perforation occurred, although both patients were in a service hospital for filariasis. Neither patient had diarrhea, weakness or fever before perforation.

3. Incomplete reliance can be placed on the complement fixation test for the diagnosis of amebiasis because the incidence of errors, both positive and negative, is too great. It is not a substitute for a competent stool examination.

4. Authoritative textbooks are Stitt's Diagnosis, Prevention and Treatment of Tropical Diseases; Strong, volume I, published by the Blakiston Company, Philadelphia, 1944; Clinical Parasitology, by Craig and Faust, published by Lea & Febiger, Philadelphia, 1945, and the Etiology, Diagnosis and Treatment of Amebiasis, by Craig, Baltimore, Williams & Wilkins Company, 1944.

5. The symptomatology described is compatible with, but not diagnostic of, amebiasis. The diagnosis would depend on the stool examinations.

THIOCYANATES FOR HYPERTENSION

To the Editor:—What is the present status of the treatment of hypertension with the thiocyanates?

Daniel B. Lynch, M.D., Albany, N. Y.

Answer.—Diametrically opposed views are held as to the advisability of the treatment of hypertension with thiocyanates. Several authorities consider potassium or sodium thiocyanate the most important drug available for the management of hypertension. They believe that when used properly toxic effects may be avoided and that appreciable drops in blood pressure and symptomatic improvement result. On the other hand, many authorities consider the use of the drug irrational and undesirable. They point out that the drug acts solely as a sedative and that equally effective results may be obtained by the use of safer drugs or by other symptomatic measures. In experimental animals thiocyanates fail to reduce the blood pressure. All authorities agree that the use of thiocyanates effectively requires the maintenance of a blood concentration of 8 to 12 mg. per hundred cubic centimeters. Blood levels must be determined to ensure adequate doses and to avoid toxic effects which may at times occur at relatively low blood levels. Patients past the age of 60 do not tolerate the drug well, nor should it be used for patients with a previous history of angina pectoris, congestive heart failure, renal insufficiency or encephalopathy.

CONTACT DERMATITIS FROM RUBBER ACCELERATOR

To the Editor:—A man aged 25 works in a hybrid seed corn plant. The corn is treated with "Arasan"-Dupont (50 per cent Tetramethyl Thiuramdisulfide). On handling the bags of seeds after the treated corn has been dried he develops a dermatitis of the face and hands and arms which is apparently a result of an allergy to this Arasan dust. The dermatitis is red and scaly, and it causes subjective symptoms of burning and smarting. Can you suggest any type of protective ointment against this substance or a way to desensitize the patient?

J. M. Hennessey, M.D., Manilla, Iowa.

Answer.—Tetramethyl Thiuramdisulfide under the trade name of Tuads has been used as a rubber accelerator for many years and has been reported as a cause of allergic dermatitis in the rubber industry as well as causing dermatitis on the hands of workers wearing rubber gloves which contained it (Schwartz, Louis, and Tulipan, Louis: Occupational Diseases of the Skin, Philadelphia, Lea & Febiger, 1939, p. 375).

Ointments do not rate high as protectives against contact dermatitis, but if it is desired to try a protective ointment against the dust of Arasan the type that leaves a dry, water insoluble film on the skin such as West number 77 might be suggested.

Desensitization against Tuads has not been tried, but if such an experiment is to be inaugurated the agent might be dissolved in ethylalcohol and the procedure begun by subcutaneous injection of a low concentration, i. e. one drop of 1 : 1,000,000 dilution, the dose being increased according to the patient's reaction.

It is believed that protection of the hands and arms with rubber gloves (not containing Tuads) and impervious sleeves, using the protective ointment only on the face and wearing goggles, will give better protection, especially if those exposed take a shower bath after work and change to clean clothes.

PROLONGED AMENORRHEA AND PREGNANCY

To the Editor:—A woman aged 32 had a normal menstrual period at regular intervals until four years ago. Then she stopped menstruating. She never was pregnant. She looked healthy and appeared somewhat younger than her given age. Her height was 63½ inches (160 cm.), her weight 115½ pounds (52 Kg.). The distribution of the body hair appeared perfectly normal. Her breasts were somewhat small and firm. On pressure the breasts excreted a milky, watery fluid, a condition which persisted since the premature menopause mentioned. Pelvic examination revealed a normal cervix, although the vaginal vaults were not deep. The uterus appeared in anteflexion, the total length being not more than 3 cm., with a corpus estimated about 1 cm. long. The adnexa were free. For psychologic reasons I induced a uterine flow with estrogenic substance. I did this repeatedly. However, when I stopped the medication she did not flow any more. The patient is desirous of having a child. Is there any chance of pregnancy? What is the significance of the secretion of the breasts which are free of any tumor formation such as an adenoma? What treatment, if any, is possible?

Ludwig Gruenewald, M.D., Sheboygan, Wis.

ANSWER.—The outlook for a pregnancy in a case like this is not too good. It is possible that in spite of the amenorrhea for four years and the atrophied uterus there is a remote possibility of the occurrence of ovulation and menstruation without any therapy and without apparent reason. However, this should not be counted on. There are two procedures which may yield the desired outcome. One is the use of hormones and the other is x-ray stimulation of the pituitary gland. Glandular treatment should be tried first. The basal metabolic rate should be determined once or more to make sure there is no need for thyroid medication. Most likely the thyroid function of this patient is normal. Therapy then will consist in the administration of a combination of equine and chorionic gonadotropins, the so-called one-two cyclic gonadotropic therapy recommended by Hamblen and Davis (*Am. J. Obst. & Gynec.* **50**:137 [Aug.] 1945). Prior to using this therapy the patient should be skin tested with the equine gonadotropic preparation to rule out possible allergy. If the patient is allergic, this hormone treatment should not be used. Hamblen and Davis give their patients 400 international units of the equine gonadotropic preparation intramuscularly every day for ten days. During each of the next ten days the patients receive 500 international units of chorionic gonadotropin intramuscularly. If bleeding does not follow this treatment, a number of months should be permitted to elapse before it is repeated.

Ostergaard of Copenhagen (quoted by Greenhill, J. P.: Year Book of Obstetrics and Gynecology, Chicago, Year Book Publishers, 1947, pp. 586-587) recommends the following schedule for cases of amenorrhea of long standing in women past 30 years of age: Equine gonadotropin 3,000 international units is given every day for five days and then chorionic gonadotropin 1,500 international units is given every second day three times. The first menstrual period usually appears about two weeks after the first injection of chorionic gonadotropin. Out of 100 women treated in this way about 50 per cent had normal menstruation, about 35 per cent had only one bleeding episode after treatment, and 15 per cent had no bleeding at all. A few women became pregnant.

If endocrine therapy fails, x-ray therapy may be applied to the pituitary gland. Thus far harm has not been reported from this treatment, but in lower animals abnormalities appear in the third and fourth generations following radiation. The treatment is simple.

There is no satisfactory explanation for the discharge from the breasts except perhaps that the prolactin element of the anterior pituitary gland is functioning.

FIBROSITIS

To the Editor:—What is the prognosis of primary periarticular fibrositis, acute and chronic? Does primary chronic periarticular fibrositis produce severe disability when the entire spine, shoulders, knees, buttocks and hands are involved? What is the prognosis of periarticular fibrositis secondary to osteoarthritis where the entire spine is involved? What is the degree of disability produced in this type of case? What is the degree of disability where hands, shoulders, entire spine and knees are involved?

Louis M. Magee, M.D., Natchez, Miss.

ANSWER.—Primary periarticular fibrositis produces articular stiffness and pain which are generally transient and recurrent, not chronic. Even in chronic cases symptoms vary from day to day and from hour to hour, generally being worse after some hours of rest (morning jelling), better after moderate activity, worse after strenuous physical exertion. After the patient "limbers up" in the morning he may be relatively free from symptoms for the rest of the day or until the end of a physically tiring day. Except in special localized forms (for example, capsular fibrositis of the shoulder) there are no objective manifestations of disease: no flexion deformities, muscular atrophy, articular swelling. Stiffness is subjective. Roentgenograms and sedimentation rates are normal.

Primary periarticular fibrositis is a condition of unknown cause apparently unrelated to any other disease. It probably results from some obscure chemical abnormality, not from inflammatory changes in affected periarticular tissues. The prognosis is good: it may last days, weeks or months but usually disappears in time, always without residual damage. Generally it is satisfactorily controlled by reassurance, physical therapy and aspirin.

Since primary periarticular fibrositis rarely affects patients as widely as in the inquirer's illustration and does not produce notable disability, a review of the diagnosis is in order. Many cases called "diffuse fibrositis" are in reality cases of "psychogenic rheumatism" (Hench, P. S., and Boland, E. W.: *Ann. Int. Med.* **24**:808 [May] 1946). Others are not primary fibrositis but represent "secondary fibrositis," the fibrositic component of a mild or impending rheumatoid arthritis. In such cases certain constitutional reactions may be developing (increased sedimentation rate, loss of weight and appetite, secondary anemia) even though roentgenograms are still negative and articular swellings absent. In cases of "secondary fibrositis of rheumatoid arthritis" muscular atrophy and flexion deformities may develop and biopsies of muscles may reveal localized inflammatory foci of considerable diagnostic interest (Freund, H. A.; Stiener, Gabriel; Leichtentritt, Bruno, and Price, A. E.: *Science* **101**:202 [Feb. 23] 1945. Gibson and others *Ann. Rheumatic Dis.* **5**:131 [June] 1946). These foci have not been reported in cases of primary fibrositis or of fibrositis secondary to osteoarthritis.

Periarticular fibrositis secondary to osteoarthritis is common; indeed it has been stated that "senility is synonymous with fibrositis" but it is also, like primary fibrositis, relatively benign. The disability may be mild or moderate but depends more on the associated osteoarthritis than on the accompanying fibrositis. The prognosis depends on the amount and location of the osteoarthritis present. The prognosis in osteoarthritis is much better (as far as progressive and polyarticular disability is concerned) than it is in rheumatoid arthritis.

NEUROFIBROMATOUS TUMORS

To the Editor:—A white man aged 27 has multiple superficial mildly firm tumor masses which are suggestive of neurofibromas or von Recklinghausen's disease. Several of these have been removed while in the armed forces, but others are occurring. The modern surgical textbooks suggest surgery for the masses, which may be painful because of pressure on nerves. Since the surgical therapy is palliative, is some other approach such as vitamin B therapy possible?

O. L. Bettag, M.D., Pontiac, Ill.

ANSWER.—Tumors of neurofibromatosis need be removed only for cosmetic reasons or when they become painful because of pressure on nerves. Malignant changes have occasionally been reported. Surgical removal is the method of choice. There is no evidence to indicate any benefit from vitamin or endocrine therapy.

GLUTAMIC ACID AND MENTAL RETARDATION

To the Editor:—I would appreciate any information about the use of glutamic acid to improve mental development.

Roy M. Greenthal, M.D., Milwaukee.

ANSWER.—Glutamic acid is of unquestionable benefit in some cases of petit mal epilepsy, and if the seizures are accompanied with psychomotor attacks or retardation the mental condition is usually improved also. If grand mal attacks are present, diphenylhydantoin sodium should be given as well as glutamic acid.

In cases of mental retardation without seizures, the results are more questionable, but beneficial effects have been reported. A trial is at least harmless.

Glutamic acid must be given in massive doses, 18 to 24 Gm. a day for an adult and roughly in proportion to weight for children. The good effects, if any, develop rather slowly over several months.

EPITHELIOMA OF FACE

To the Editor:—Can an epithelioma of the face be cured with an electric needle? I have used Marsden's paste; the reactions are severe but the final results have been satisfactory.

F. W. Didier, M.D., Mill Valley, Calif.

ANSWER.—Epithelioma of the face is best treated either by surgical excision or by irradiation. Electrodesiccation may be used in the treatment of hyperkeratoses and as a palliative procedure in extensive carcinoma of the face or in the control of a small recurrence in a previously irradiated area. The effect of Marsden's paste is caustic. The results are unpredictable and unreliable. Its use is not recommended.

RAGWEEDS IN EUROPE

To the Editor:—Perhaps you could furnish me with information as to the prevalence of ragweed in Europe, especially France, Belgium and Switzerland. A patient of mine will make a trip there this summer and requests this information.

Harry H. Lebow, M.D., West Hempstead, L. I., N. Y.

Answer.—Bray has made the statements that "the American ragweeds are absent from the British Isles and Europe" and that "the European hay fever producing flora is essentially different from the American in so far as the Ambrosiaceae and the Artemisia groups of pollens are absent." For all practical purposes of exposure of ragweed sensitive persons these statements are probably true. Actually there is a native species of Ambrosia in the Mediterranean area, though its distribution is too limited to be of any allergic importance. The American ragweeds Ambrosia elatior and Ambrosia trifida have been introduced in various parts of central and northern Europe, particularly Germany and France. Gutmann mentions particularly the harbor cities and certain river ports on the Rhine. He says, however, that the season is too short for maturation of seeds, so that the introductions are not permanent. Various species of Artemisia, such as Artemisia vulgaris and Artemisia absinthium, are native in almost all countries of Europe. Their pollen if abundant enough could cause symptoms in ragweed sensitive persons, but the variable experience of ragweed sensitive Americans in Europe has been entirely satisfactory. It must be concluded that the amounts of any sort of air borne composite pollen in any part of the British Isles and Europe is too small to cause active symptoms.

AIR TRAVEL FOR INFANTS

To the Editor:—What are the dangers in air travel for infants under 1 year of age? Are any special precautions to be taken when traveling by air?

Robert J. Antos, M.D., Phoenix, Ariz.

Answer.—While there have been rumors that air travel is not well tolerated by infants, this has not been confirmed by investigation. The medical director of the United Airlines reports that in a survey conducted during 1941 and 1942 on every baby flown in the United Mainliners a healthy baby reacts better to flight conditions than most adults. It was stated that babies have frequently been flown with their mothers the moment the latter were released from hospitals following confinement. During the war a large number were flown.

An infant's ears adjust to altitude more easily than an adult's, probably because their eustachian tubes are short and straight.

Airsickness is a rarity. There have been reports of vomiting, but this apparently is due to regurgitation of food when the infant is fed aloft. The gas expansion which takes place at altitude results in a regurgitation unless great care is taken to prevent the infant from swallowing air while being fed.

The medical director of the United Airlines states that statistics and reports confirm his personal observation that there is no danger in air travel for an infant under 1 year of age.

ABORTION AND GERMAN MEASLES

To the Editor:—Is it justifiable to recommend abortion in cases of German measles during pregnancy in order to avoid congenital deaf-mutism, cataract, heart anomalies and mental retardation?

M.D., New York.

[This inquiry was referred to two consultants, whose respective replies follow.]

Answer.—Abortions should not be done because the mother has German measles during pregnancy. There are no adequate statistical studies to justify a positive conclusion that a child will suffer with congenital malformations. Although Swan, Tostevin, Mayo and Black (*M. J. Australia* **1**:409 [May 6] 1944) have indicated that an abortion should be debated and Reese (*Am. J. Ophth.* **27**:483 [May] 1944) also discusses this question, Fox and Bortin (The Journal, March 2, 1946, p. 568) conclude from their survey and Milwaukee Health Department studies that the termination of pregnancy because of rubella is not justified.

Answer.—In De Lee-Greenhill's Textbook of Obstetrics (Philadelphia, W. B. Saunders Company, 1947, p. 431) it is stated that "in 1941 Gregg discovered that most babies born of mothers who had German measles in the early months of pregnancy were born with defects of the eye. Since then there has been ample proof (109 cases in Australia alone up to 1944) to show that when German measles occurs in the first three months of gestation at least 60 to 70 per cent of the babies will show congenital abnormalities such as cataract, cardiac disease, deafmutism, microcephaly, dental defects and glomerular sclerosis. Because of this we believe an abortion is justified if German measles develops in a pregnant woman during the first three months of pregnancy."

In 1944 J. C. Prendergast (*Arch. Ophth.* **35**:49 [Jan.] 1946) questioned 37 ophthalmologists, 24 pediatricians and 32 obstetricians in California to determine the incidence of congenital anomalies in children born to mothers who had rubella in the first three months of pregnancy. A total of 80 cases of cataract, 10 cases of other ocular defects (congenital glaucoma, microphthalmus, pigmentation of the retina, corneal opacities and strabismus), 32 cases of cardiac defects and 10 cases of other congenital anomalies were reported. Some duplication of cases undoubtedly existed, 2 especially in the field of ocular abnormalities. Of a total of 10 cases of rubella in the first three months of pregnancy reported by obstetricians, congenital anomalies resulted in 6 of the offspring. Since not all men who might see congenital defects were reached, figures for the state are necessarily incomplete.

The third series of congenital abnormalities in infants following German measles during pregnancy in Australia was reported by Swan and Tostevin (*M. J. Australia* **33**:645 [May 11] 1946). In addition to the 136 previously studied, the authors report 58 new cases. The authors consider therapeutic abortion entirely justified in any case in which rubella is contracted in the first few months of pregnancy. If the infection occurs shortly before conception there is evidently no need for worry.

The only article which questions the specific connection between German measles and pregnancy is the one by Fox and Bortin (The Journal, March 2, 1946, p. 568). In a series of 11 cases of rubella, of which 9 occurred during the first four months, there was only 1 monstrosity. On the basis of these data the authors feel that consideration of therapeutic abortion following rubella is unwarranted. In commenting on this article J. P. Greenhill (Year Book of Obstetrics, Year Book Publishers, Chicago, 1947, p. 323) says "I am convinced of the connection (rubella in the early months of pregnancy and the occurrence of malformations in the newborn baby) and therefore advocate termination of the pregnancy if the rubella appeared either just before a menstrual period was missed or during the first three months of pregnancy."

CHAULMOOGRA OIL FOR ARTHRITIS

To the Editor:—What is the status of the treatment of arthritis with the use of chaulmoogra oil by mouth? What is the technic of therapy and what relationship, if any, has the age of the patient to this type of therapy?

Harold E. James, M.D., Sanitarium, Calif.

Answer.—Since about 1926 chaulmoogra oil has been occasionally recommended for the treatment of chronic arthritis. McIlhenny, an orthopedic consultant to a leprosarium, made the observation that the "secondary type of infectious arthritis" did not affect leprosy treated by intramuscular injections of chaulmoogra oil. Thereafter he treated 39 patients with rheumatoid arthritis or osteoarthritis. Presumably improvement frequently occurred; some patients supposedly became "symptom free" within eight weeks.

Since then about five other reports have appeared dealing with the treatment of various types of arthritis in about 350 cases. In general the terminology used was vague: although some cases were labeled "atrophic arthritis" or "hypertrophic arthritis" (at times erroneously), other cases were labeled "chronic arthritis" or just "arthritis." The results were uncritically and enthusiastically appraised; the effects were sometimes "truly astonishing," "symptoms disappeared in almost all cases" and so forth. Little or no statistical or clinical evidence was given to support these claims.

Focal and general reactions to the intramuscular injections were common and included increased articular pains, malaise, fever, headaches, gastrointestinal symptoms, urticaria and others. Injections were often painful, and sterile abscesses developed in 5 to 8 per cent of cases. Although probably somewhat analogous to reactions to foreign protein, those to chaulmoogra oil appear to be distinctly less preferable than reactions to triple typhoid vaccine, and the results are no better.

The oral use of chaulmoogra oil was regarded as ineffective by Hebert (1933) and by Smith, Blocker and Tumen (1938), but a later worker, Burnett (1941), concluded that it was useful: of 100 cases of chronic arthritis (types?) "improvement" was noted in 75 per cent. Even so, gastrointestinal symptoms often necessitated cessation of treatment.

Such treatment is not recommended. As Dr. Joseph Miller of Chicago once put it, "The inevitable 75 per of arthri are in time 'improved' (whatever that means) by almost anything or almost nothing"; such is the natural variability and course of chronic arthritis of the rheumatoid or osteoarthritic types. Only six proponents of this type of treatment have appeared in twenty years, the last indexed report having appeared more than five years ago. The reports to date have been enthusiastic and likewise unimpressive. This treatment has not obtained the approval of a single nationally known rheumatologist. One writer considered it significant that the two earliest advocates of this treatment published "preliminary reports" but did not see fit to present later reports.

URTICARIA AND Rh NEGATIVE BLOOD

To the Editor:—A woman aged 31 has had three pregnancies. The first was successful, and the child is living and well at the age of 5 years. The second resulted in a miscarriage at some stage unknown to me. The third was a twin pregnancy and during this the mother was found to be Rh negative. The obstetrician, with considerable difficulty, carried her through to practically full term and the babies are now some 3 months old and doing well. Since the pregnancies the mother has had a great deal of disturbance on account of urticaria. She has a hemoglobin of 13.5 Gm. per hundred cubic centimeters, 4,450,000 red blood cells and 9,500 leukocytes, with lymphocytes of 24 per cent which are small, neutrophils 70 per cent with 67 segmented, endothelials 3 per cent, eosinophils 2 per cent and basophils 1 per cent. There is no disturbance in shape or size of erythrocytes. The blood sugar is 105 mg., nonprotein nitrogen 19 mg. per hundred cubic centimeters, uric acid 3.0 mg. per hundred cubic centimeters, creatinine 0.8 per cent, cholesterol 150 mg. per hundred cubic centimeters and coagulation time less than 1 minute. There is normal urine, good concentration both fasting and postprandial, with specific gravity ranging from 1.024 to 1.026, a slight reduction of sugar in each specimen and no acetone, a slight trace of albumin in each specimen and considerable urobilinogen in each specimen. The sediment showed a few erythrocytes and a few leukocytes per high power field but no casts. Feces are not remarkable. I assume that during the pregnancy she has become sensitized and that I am dealing with some sort of allergy manifested in an Rh negative woman. Can you suggest any type of treatment?

Francis T. Jantzen, M.D., Boston.

Answer.—There is no evidence that any of this patient's children had erythroblastosis fetalis. An Rh negative mother giving birth to a child with erythroblastosis would have an increase in anti-Rh agglutinins and therefore might have a severe reaction from the transfusion of Rh positive blood. There is no known sensitization in such a patient that might be associated with urticaria.

A patient like this should have a glucose tolerance test to rule out a mild diabetes. The management of the urticaria is the same as for any patient. Benadryl and pyribenzamine have proved beneficial in many such cases.

ROCKY MOUNTAIN SPOTTED FEVER

To the Editor:—In the discussion of Rocky Mountain spotted fever mention is seldom made of the long lasting sequelae. Wolbach in Cecil's "Textbook of Medicine" mentions deafness, mental confusion and slurred speech as sequelae which last only a few weeks. Is there any record of serious neurologic sequelae which persist over a period of years? Also is Michigan among the states mentioned as being a state in which the disease has been contracted? I know that the disease has occurred here, but the patients were usually people who may have contracted it elsewhere and were traveling through Michigan. Thank you for any assistance you may offer.

Louis Berlin, M.D., Ann Arbor, Mich.

Answer.—Long lasting sequelae in Rocky Mountain spotted fever are quite rare, although there are a few reports in the literature which indicate that neurologic sequelae have occurred. During the acute stage of the illness it is not unusual to observe diminution in hearing, some diplopia and mental confusion. These conditions, however, usually clear up rapidly in convalescence.

The changes caused by the disease, which primarily consist of thrombonecrosis of the small arterioles and capillaries occurring commonly in the skin, heart, kidney and brain, explain neurologic symptoms and signs.

Several investigators who have seen many cases of spotted fever have remarked that they have never seen any permanent sequelae whatever. One of them has stated that he did see a case of encephalitis following Rocky Mountain spotted fever in a 6 year old girl which now has been followed up for five years. The encephalitis entirely disappeared within six weeks after the acute illness, and no residual has appeared to date.

Rocky Mountain spotted fever has been reported in forty-two of the forty-eight states up to the present time. Michigan is one of the states which has not as yet reported a case of Rocky Mountain spotted fever as being contracted within the confines of that state. Several cases have been reported from Michigan, but they were contracted elsewhere.

RABIES AND COYOTES

To the Editor:—I have recently been asked for an opinion concerning the prophylactic use, in anticipation of being bitten, of the Pasteur antirabic treatment. The person who is interested is engaged in the trapping and extermination of coyotes and in the course of his activities is frequently bitten by these animals. There is, of course, no practical way in which he can capture them and keep them under observation, and he has no way to know whether there is any likelihood of any given animal being infected. Would it be effective and reasonably safe to give him the treatment before he begins his summer's work?

M.D., Colorado.

Answer.—In view of the success of antirabic treatment by vaccination after the bite by a rabid animal, it can safely be concluded that vaccination against rabies before the bite would be "effective and reasonably safe." But how long the prevention would last after the preventive treatment is not known. Repeated treatments might be followed by undesirable sensitization. After all the best and safest way to escape rabies is effective mechanical protection against being bitten or otherwise infected by a rabid animal.

VACCINATION

To the Editor:—I have a child patient whose mother states she was vaccinated twice with cowpox. The first time the child became very ill and the second time almost died, being unconscious for three days. Neither of these attempts at vaccination was successful. What can be done in this case? The child will soon be of school age and vaccination will be required.

William B. Barr, M.D., Allentown, Pa.

Answer.—This case is extremely unusual. Is there any proper reason for believing that the mother's statements require verification?

Assuming that the child is hypersensitive to cowpox vaccine, it would be advisable to obtain vaccine which has been developed in the chick embryo? With the latter material, using a 1:10 dilution in isotonic solution of sodium chloride, a sensitivity test may be made by means of multiple pressure on a clean area of the skin. If there is a local reaction it should result in a successful vaccination. If there is no reaction, vaccination with the undiluted chick embryo vaccine should be attempted. Employ the multiple pressure method. Do not penetrate the skin with the needle. Hold the needle parallel with the skin surface.

FREQUENCY OF MISCARRIAGE IN FIRST PREGNANCY

To the Editor:—What is the overall percentage of women who lose the first pregnancy by miscarriage or abortion from all causes?

J. Joseph Klar, M.D., Springfield, Mass.

Answer.—An answer to this query may be found in the report by Hudson and Rucker (The Journal, Oct. 20, 1945, p. 542), who studied the histories of their last thousand pregnant patients for the termination of the pregnancy. Of the 480 women in this series who were pregnant for the first time, 49 aborted spontaneously. However, as only 10.2 per cent of the primigravidas aborted spontaneously as compared with 9.4 per cent of the whole series, this group does not seem to be important numerically.

ROUTE FOR ADMINISTRATION OF INFLUENZA VACCINE

To the Editor:—Please advise whether there is any great advantage in giving the influenza vaccine intradermally over the subcutaneous method. What is the likelihood of reactions by both methods, and which method should be used for mass immunization?

William A. Doebele, M.D., Huntingdon, Pa.

Answer.—There have not been published data to date of sufficient scope to establish comparative values of subcutaneous or intracutaneous inoculation. The great bulk of data have been obtained with subcutaneous inoculations.

REFRACTORY PRURITUS

To the Editor:—In Queries and Minor Notes I have read replies to queries with regard to the treatment of generalized pruritus without obvious skin lesions. After suggesting several measures that I believe will prove therapeutically ineffective, it is suggested, as a last resort, that the services of a psychiatrist be sought. After the latter has failed, as I believe he will, I think the patient might be referred to one of the older general practitioners. In the last five years I have seen 4 such cases of pruritus. Three have been permanently cured by intravenous calcium injections with advice as to diet high in calcium content. In 1 case the treatment has had to be repeated. I believe any of the calcium preparations for intravenous use will suffice: gluconate, levulinate or neo-cal-glucon. The injection should be given every second day until six doses are given.

T. J. Brennan, M.D., San Francisco.

SECTION OFFICERS 1947-1948

Internal Medicine—Chairman, Cecil J Watson Minneapolis Vice Chairman, James A Greene, Dallas Texas, Secretary, Walter L Palmer 950 East 59th Street, Chicago

Surgery, General and Abdominal—Chairman Burr N Carter Cincinnati, Vice Chairman Warren H Cole, Chicago, Secretary, Michael I DeBakey, 1430 Tulane Avenue, New Orleans 13

Obstetrics and Gynecology—Chairman William F Mengert, Dallas Texas, Vice Chairman Robert L Faulkner, Cleveland, Secretary, Arthur B Hunt, 102 Second Avenue S W, Rochester Minn

Ophthalmology—Chairman Everett L Goar, Houston Texas, Vice Chairman, Francis Heed Adler, Philadelphia, Secretary, Trygve Gundersen, 101 Bay State Road Boston

Laryngology, Otology and Rhinology—Chairman, Fletcher D Woodward, Charlottesville, Va Vice Chairman John R Simpson, Pittsburgh, Secretary, J Milton Robb, 1553 Woodward Avenue, Detroit

Pediatrics—Chairman Oscar Reiss, Los Angeles, Vice Chairman, Stanley Gibson, Chicago, Secretary, Margaret Mary Nicholson, 1801 Eye Street N W, Washington, D C

Experimental Medicine and Therapeutics—Chairman, Walter Bauer, Boston, Vice Chairman Dwight L Wilbur, San Francisco, Secretary, Carl V. Moore, 600 South Kingshighway, St Louis

Pathology and Physiology—Chairman, Alvin G Foord, Pasadena Calif, Vice Chairman, George E Wakerlin, Chicago, Secretary, Edwin F Hirsch, 1439 South Michigan Avenue, Chicago

Nervous and Mental Diseases—Chairman A R Vonderahe Cincinnati Vice Chairman, William A Smith, Atlanta Ga, Secretary, Frederick P Moersch, 102 Second Avenue S W, Rochester, Minn

Dermatology and Syphilology—Chairman Henry E Michelson Minneapolis, Vice Chairman Carroll S Wright, Philadelphia Secretary, Clinton W Lane 508 North Grand Boulevard, St Louis

Preventive and Industrial Medicine and Public Health—Chairman Robert H Riley Baltimore, Vice Chairman Oscar A Sander, Milwaukee Wis Secretary Rutherford T Johnstone 727 West Seventh Street, Los Angeles

Urology—Chairman, Reed M Nesbit, Ann Arbor, Mich, Vice Chairman Earl E Ewert, Boston, Secretary, Edward N Cook, 102 Second Avenue S W, Rochester, Minn

Orthopedic Surgery—Chairman J Warren White Greenville S C Vice Chairman David M Bosworth, New York, Secretary, Joseph S Barr, 234 Marlborough Street, Boston

Gastro-Enterology and Proctology—Chairman Sara M Jordan Boston Vice Chairman William H Daniel, Los Angeles, Secretary, Grant H Laing, 101 South Michigan Boulevard Chicago

Radiology—Chairman W W Wasson Denver, Colo, Vice Chairman Harry M Weber, Rochester, Minn, Secretary, U V Portmann 2020 East 93d Street Cleveland.

Anesthesiology—Chairman Ralph M Tovell Hartford Conn Vice Chairman, Stuart C Cullen, Iowa City, Secretary, John S Lundy, 102 Second Avenue S W, Rochester, Minn

General Practice of Medicine—Chairman Eric A Royston, Los Angeles, Vice Chairman, Milton B Casebolt, Kansas City, Mo, Secretary, Winfred B Harm 3884 West Vernor Highway, Detroit

JOURNALS ABSTRACTED IN THE CURRENT MEDICAL LITERATURE DEPARTMENT, MAY—AUGUST 1947

Titles have been listed or abstracts made of important articles in the following journals in the Current Literature Department of The Journal during the past four months. Any of the journals, except those starred, will be lent by The Journal to subscribers in continental United States and Canada and to members of the American Medical Association for a period not exceeding three days. Three journals may be borrowed at a time. No journals are available prior to 1936. Requests for periodicals should be addressed to the Library of the American Medical Association and should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Thus most of these journals are accessible to the general practitioner.

SUBJECT INDEX

This is an index to all the reading matter in THE JOURNAL. In the Current Medical Literature Department only the articles which have been abstracted are indexed.

The letters used to explain in which department the matter indexed appears are as follows: "BI," Bureau of Investigation; "E," Editorial; "C," Correspondence; "OS," Organization Section; "ab," abstracts; the star (*) indicates an original article in THE JOURNAL.

This is a subject index and one should, therefore, look for the subject word, with the following exceptions: "Book Notices," "Deaths," "Medicolegal Abstracts" and "Societies" are indexed under these titles at the end of the letters "B," "D," "M," and "S." Matter pertaining to the Association is indexed under "American Medical Association." The name of the author, in brackets, follows the subject entry.

For author index see page 1631.
